Multiple Choice: (8 points. No part credit. Circle your answers.)

1. (8 points) Consider the general partial fraction expansion $\frac{x^3 - x^2}{(x^2 + 4)^2} = \frac{Ax + B}{x^2 + 4} + \frac{Cx + D}{(x^2 + 4)^2}$.

Find the coefficients. (Circle 1 answer in each row.)

$A =$ -4 -3 -2 -1 0 1 2 3 4

$B =$ -4 -3 -2 -1 0 1 2 3 4

$C =$ -4 -3 -2 -1 0 1 2 3 4

$D =$ -4 -3 -2 -1 0 1 2 3 4

Work Out: (Points indicated. Part credit possible. Show all work.)

2. (10 points) Given the partial fraction expansion $\frac{2x - 2}{x^4 - 1} = \frac{1}{x + 1} + \frac{1 - x}{x^2 + 1}$, compute $\int_0^1 \frac{2x - 2}{x^4 - 1} dx$.
Simplify and evaluate all trig and inverse trig functions.

3. (10 points) Compute $\int_0^1 \frac{e^{-x}}{1 - e^{-x}} dx$ or show why it diverges and whether it is ∞ or $-\infty$.

4. (10 points) Show why $\int_1^\infty \frac{x + \sin x}{x^{5/2}} dx$ converges or diverges.

5. (10 points) A cup is made by revolving the curve $x = \sin y$ about the y -axis for $0 \leq y \leq \frac{\pi}{2}$. Find its volume.

6. (10 points) A cone is made by revolving the line $y = 2x$ about the y -axis for $0 \leq y \leq 6$ cm. It is filled with water up to a depth of 4 cm. It is sucked out a straw which reaches 3 cm above the top of the cone. How much work is done? Give your answer as a multiple of $g\delta$ where g is the acceleration of gravity and δ is the density.

7. (10 points) Solve the initial value problem:

$$\frac{dy}{dx} = \frac{x^2}{y^2} \qquad y(1) = 3$$

Find the general (explicit) solution and then find $y(0)$.

8. (10 points) Solve the initial value problem:

$$\frac{dy}{dx} = 2xy + e^{x^2} \qquad y(0) = 4$$

Find the general (explicit) solution and then $y(1)$.

9. (5 points) The plot at the right is the slope field for the differential equation

$$\frac{dy}{dx} = x^2 + y^2$$

On the plot, draw the solution curve satisfying the initial condition

$$y(0) = \frac{1}{2}$$

10. (20 points) A pot contains 1000 L of sugar water with a concentration of $0.01 \frac{\text{kg sugar}}{\text{L water}}$. Sugar water with a concentration of $0.04 \frac{\text{kg sugar}}{\text{L water}}$ is poured into the pot at $50 \frac{\text{L}}{\text{min}}$. The sugar water is kept mixed and drains from the tank at $50 \frac{\text{L}}{\text{min}}$.

Let $S(t)$ be the kg of sugar in the pot at time t .

a. How much sugar is in the tank at $t = 0$?

$$S(0) = \underline{\hspace{2cm}}$$

b. What is the differential equation for the rate of change of $S(t)$?

$$\frac{dS}{dt} = \underline{\hspace{10cm}}$$

c. How much sugar is in the pot at time t ?

$$S(t) = \underline{\hspace{10cm}}$$

d. Is the sugar in the pot increasing or decreasing with time?

Circle: Increasing Decreasing_
