Theory

Idea: You want conjectures that are an improvement on existing theory.

Theory

Idea: You want conjectures that are an improvement on existing theory.

property = pairs_have_unique_common_neighbor

theory = $[is_k3]$

```
propertyBasedConjecture(graph_objects, properties,
    property, theory = theory, sufficient = True,
    precomputed = precomputed)
```

Theory

Idea: You want conjectures that are an improvement on existing theory.

property = pairs_have_unique_common_neighbor

theory = $[is_k3]$

propertyBasedConjecture(graph_objects, properties, property, theory = theory, sufficient = True, precomputed = precomputed)

Conjecture:

Proof Sketch Generating Idea

- Prove: $P \implies Q$.
- Run necessary condition conjectures for P, using Q as the "theory".
- The generated conjectures must be "better" than Q for at least one graph conjectures.

Get:

$$P \implies C_1$$
$$P \implies C_2$$

- ▶ By the truth test, each object x that has property P has properties C₁ and C₂.
- ► Thus x is in the intersection of the set of graphs having properties C₁ and C₂.
- If there is x in the graph database with x in C₁ ∩ C₂ but x ∉ Q then program wouldn't stop—as conjectures could be improved.

Proof Sketch Generating Idea

- Prove: $P \implies Q$.
- Run necessary condition conjectures for P, using Q as the "theory".
- Lemma 1:

$$P \implies C_1$$

Lemma 2:

$$P \implies C_2$$

Lemma 3:

 $C_1 \cap C_2 \subseteq Q$

Then lemmas imply Theorem:

$$P \implies Q$$

(semantic proof)

If every pair of people in a group have exactly one friend in common, then there is a person in the group that is friends with all of them.

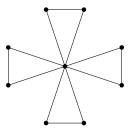

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

If every pair of people in a group have exactly one friend in common, then there is a person in the group that is friends with all of them.

If every pair of vertices in a graph have a unique common neighbor, then there is a vertex in the graph that is adjacent to all the other vertices (Erdős, Rényi, Sós, 1966).

The Friendship Theorem

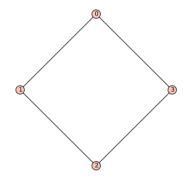

If every pair of vertices in a graph have a unique common neighbor, then there is a vertex in the graph that is adjacent to all the other vertices.

The Friendship Theorem

If every pair of vertices in a graph have a unique common neighbor, then there is a vertex in the graph that is adjacent to all the other vertices.

Useful Observation: Can't have any four-cycles.

▲□▶ ▲圖▶ ▲臣▶ ▲臣▶ ―臣 … のへで

(pairs_have_unique_common_neighbor)->(is_circular_planar)

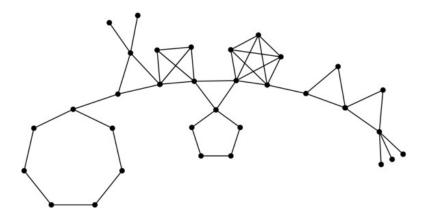

Theorem (Chartrand & Harary, 1967) A graph is outerplanar if and only if it does not contain a subdivision of K_4 or $K_{3,3}$.

(pairs_have_unique_common_neighbor)->(is_circular_planar)

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

(pairs_have_unique_common_neighbor)->(is_gallai_tree)

Proof Main Ideas:

Two-connected Gallai-trees are complete graphs or odd cycles.

Proof Main Ideas:

- Two-connected Gallai-trees are complete graphs or odd cycles.
- Outerplanar and Gallai-tree means the blocks are odd cycles.

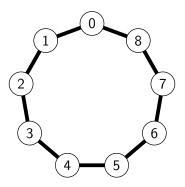

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Proof Main Ideas:

- Two-connected Gallai-trees are complete graphs or odd cycles.
- Outerplanar and Gallai-tree means the blocks are odd cycles.
- If cycle has degree two vertices then the neighbors of these vertices must be adjacent.

Proof Main Ideas:

- Two-connected Gallai-trees are complete graphs or odd cycles.
- Outerplanar and Gallai-tree means the blocks are odd cycles.
- If cycle has degree two vertices then the neighbors of these vertices must be adjacent.

Proof Main Ideas:

 Assume the graph is two-connected. It is outerplanar and eulerian.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Proof Main Ideas:

- Assume the graph is two-connected. It is outerplanar and eulerian.
- If the graph is not a cycle, there is a vertex of degree at least 4.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Proof Main Ideas:

- Assume the graph is two-connected. It is outerplanar and eulerian.
- If the graph is not a cycle, there is a vertex of degree at least 4.

Then the unique neighbor condition yields a contradiction.

Proof Main Ideas:

- Assume the graph is two-connected. It is outerplanar and eulerian.
- If the graph is not a cycle, there is a vertex of degree at least 4.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQ@

- Then the unique neighbor condition yields a contradiction.
- So the graph is a triangle.

Proof Main Ideas:

- Assume the graph is two-connected. It is outerplanar and eulerian.
- If the graph is not a cycle, there is a vertex of degree at least 4.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQ@

- Then the unique neighbor condition yields a contradiction.
- So the graph is a triangle.
- Apply induction.

Proof Main Ideas:

- Assume the graph is two-connected. It is outerplanar and eulerian.
- If the graph is not a cycle, there is a vertex of degree at least 4.

- Then the unique neighbor condition yields a contradiction.
- So the graph is a triangle.
- Apply induction.
- Assume the graph has a cut vertex v.

Proof Main Ideas:

- Assume the graph is two-connected. It is outerplanar and eulerian.
- If the graph is not a cycle, there is a vertex of degree at least 4.
- ► Then the unique neighbor condition yields a contradiction.
- So the graph is a triangle.
- Apply induction.
- Assume the graph has a cut vertex v.
- Each block is two-connected and must have the property that every pair of vertices has a unique common neighbor.

Proof Main Ideas:

- Assume the graph is two-connected. It is outerplanar and eulerian.
- If the graph is not a cycle, there is a vertex of degree at least 4.
- Then the unique neighbor condition yields a contradiction.
- So the graph is a triangle.
- Apply induction.
- Assume the graph has a cut vertex v.
- Each block is two-connected and must have the property that every pair of vertices has a unique common neighbor.
- So each block is a triangle.

Proof Main Ideas:

- Assume the graph is two-connected. It is outerplanar and eulerian.
- If the graph is not a cycle, there is a vertex of degree at least 4.
- ► Then the unique neighbor condition yields a contradiction.
- So the graph is a triangle.
- Apply induction.
- Assume the graph has a cut vertex v.
- Each block is two-connected and must have the property that every pair of vertices has a unique common neighbor.
- So each block is a triangle.
- All components of G v are Gallai trees.

If every pair of vertices in a graph have a unique common neighbor, then there is a vertex in the graph that is adjacent to all the other vertices.

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

Proof Ideas:

• Assume all pairs have a unique common neighbor.

If every pair of vertices in a graph have a unique common neighbor, then there is a vertex in the graph that is adjacent to all the other vertices.

Proof Ideas:

- Assume all pairs have a unique common neighbor.
- ► Then the graph is eulerian, outerplanar, and a Gallai-tree.

If every pair of vertices in a graph have a unique common neighbor, then there is a vertex in the graph that is adjacent to all the other vertices.

Proof Ideas:

- Assume all pairs have a unique common neighbor.
- Then the graph is eulerian, outerplanar, and a Gallai-tree.

If its two-connected, its a triangle.

If every pair of vertices in a graph have a unique common neighbor, then there is a vertex in the graph that is adjacent to all the other vertices.

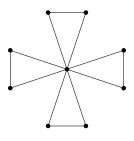

Proof Ideas:

- Assume all pairs have a unique common neighbor.
- ► Then the graph is eulerian, outerplanar, and a Gallai-tree.
- If its two-connected, its a triangle.
- If it has two or more cut-vertices, diameter is at least 3, violating the common neighbor condition.

If every pair of vertices in a graph have a unique common neighbor, then there is a vertex in the graph that is adjacent to all the other vertices.

Proof Ideas:

- Assume all pairs have a unique common neighbor.
- ► Then the graph is eulerian, outerplanar, and a Gallai-tree.
- If its two-connected, its a triangle.
- If it has two or more cut-vertices, diameter is at least 3, violating the common neighbor condition.
- So it has at most one cut vertex, and all blocks are triangles.

Kiran would have liked that.

Thank You!
