3.8: Higher Derivatives

The derivative of a differentiable function f is also a function and it may have a derivative of its own:

$$(f')' = f''$$
 second derivative

$$f''(x) = \frac{\mathrm{d}}{\mathrm{d}x}(f'(x)) = \frac{\mathrm{d}}{\mathrm{d}x}\left(\frac{\mathrm{d}}{\mathrm{d}x}f(x)\right)$$

Alternative Notation: If y = f(x) then

$$y'' = f''(x) = \frac{\mathrm{d}^2 y}{\mathrm{d}x^2} = D^2 f(x).$$

Similarly, the **third derivative** f''' = (f'')' or

$$y''' = f'''(x) = \frac{\mathrm{d}}{\mathrm{d}x} \left(\frac{\mathrm{d}^2 y}{\mathrm{d}x^2} \right) = \frac{\mathrm{d}^3 y}{\mathrm{d}x^3} = D^3 f(x).$$

In general, the n^{th} derivative of y = f(x) is denoted by $f^{(n)}(x)$:

$$y^{(n)} = f^{(n)}(x) = \frac{\mathrm{d}}{\mathrm{d}x} \left(\frac{\mathrm{d}^{n-1}y}{\mathrm{d}x^{n-1}} \right) = D^n f(x).$$

EXAMPLE 1. If $y = x^5 + 3x + 1$ find $f^{(n)}(x)$

EXAMPLE 2. Find the second derivative of $f(x) = \tan(x^3)$.

EXAMPLE 3. Let h(x) be a twice differentiable function. Find f''(x) if

$$f(x) = h(\sqrt{x}) + \sqrt{h(x)}.$$

EXAMPLE 4. Find $D^{2013} \sin x$.

EXAMPLE 5. If $f(x) = \frac{1}{x}$ find a general formula for its n^{th} derivative.

Acceleration: If s(t) is the position of an object then the acceleration of the object is the first derivative of the velocity (consequently, the acceleration is the second derivative of the position function.)

$$a(t) = v'(t) = s''(t).$$

EXAMPLE 6. If $s(t) = t^3 - \frac{9}{2}t^2 - 10t + 12$ is the position of a moving object at time t (where s(t) is measured in feet and t is measured in seconds) find the acceleration at the times when the velocity is zero.

EXAMPLE 7. Sketch the curve traced by $\mathbf{r}(t) = \langle \cos t, \sin t \rangle$ and plot the position, tangent and acceleration vectors at $t = \frac{\pi}{4}$.

Implicit second derivatives:

EXAMPLE 8. Find
$$y''(x)$$
 if $x^6 + y^6 = 66$.
