

5.3: Derivatives and Shapes of Curves

Mean Value Theorem: Suppose a function f is continuous on the (closed) interval $[a, b]$ and differentiable on the (open) interval (a, b) . Then there is a number c such that $a < c < b$ and

$$f'(c) = \frac{f(b) - f(a)}{b - a}$$

or, equivalently,

$$f(b) - f(a) = f'(c)(b - a).$$

Illustration: $m_{AB} = \frac{f(b) - f(a)}{b - a}$

EXAMPLE 1. Find a number c that satisfies the conclusion of the Mean Value Theorem on the interval $[0, 2]$ when $f(x) = x^3 + x - 1$.

EXAMPLE 2. Suppose $1 \leq f'(x) \leq 4$ for all x in the $[2, 5]$. Show that $3 \leq f(5) - f(2) \leq 12$.

Test for increasing/decreasing

- If $f'(x) > 0$ on an interval , then f is increasing on that interval.
- If $f'(x) < 0$ on an interval , then f is decreasing on that interval.
- If $f'(x) = 0$ on an interval , then f is constant on that interval.

EXAMPLE 3. Determine all intervals where the following function

$$f(x) = x^5 - \frac{5}{2}x^4 - \frac{40}{3}x^3 - 12$$

is increasing or decreasing.

First Derivative Test: Suppose that $x = c$ is a critical point of a continuous function f .

- If $f'(x)$ changes from negative to positive at $x = c$, then f has a local minimum at c .
- If $f'(x)$ changes from positive to negative at $x = c$, then f has a local maximum at c .
- If $f'(x)$ does not change sign at $x = c$, then f has no local maximum or minimum at c .

REMARK 4. The first derivative test only classifies critical points as local extrema and not as absolute extrema.

EXAMPLE 5. For function from Example 3 identify all local extrema.

EXAMPLE 6. Find all intervals of increase and decrease of f and identify all local extrema.

(a) $f(x) = xe^{2x}$

(b) $f(x) = x\sqrt[3]{x^2 - \frac{5}{3}}$

Recall here the **Second derivative test for concavity**. (see Section 5.1):

- If $f''(x) > 0$ for all x on an interval, then f is concave up on that interval.
- If $f''(x) < 0$ for all x on an interval, then f is concave down on that interval.

In addition, if f changes concavity at $x = a$, and $x = a$ is in the domain of f , then $x = a$ is an inflection point of f .

EXAMPLE 7. Find intervals of concavity and inflection points of f , if $f'(x) = 4x^3 - 12x^2$.

EXAMPLE 8. Sketch the graph of $f(x) = x^4 - x^2$ by locating intervals of increase/decrease, local extrema, concavity and inflection points.

Second derivative test for local extrema: Suppose f'' is continuous near c .

- If $f'(c) = 0$ and $f''(c) > 0$ then f has a local minimum at c .
- If $f'(c) = 0$ and $f''(c) < 0$ then f has a local maximum at c .

REMARK 9. If $f'(c) = 0$ and $f''(c) = 0$ or does not exist, then the test fails. In the case $f''(c)$ does not exist we use the first derivative test to find the local extrema.

EXAMPLE 10. Find the local extrema for $f(x) = 1 - 3x + 5x^2 - x^3$.
