

## 5 FUNCTIONS

### 5.1 Definition and Basic Properties

DEFINITION 1. Let  $X$  and  $Y$  be nonempty sets. A **function**  $f$  from the set  $X$  to the set  $Y$  is a correspondence that assigns to each element  $x$  in the set  $X$  one and only one element  $y$  in the set  $Y$ , which is denoted by  $f(x)$ .

We call  $X$  the **domain** of  $f$  and  $Y$  the **codomain** of  $f$ .

If  $x \in X$  and  $y \in Y$  are such that  $y = f(x)$ , then  $y$  is called the **value** of  $f$  at  $x$ , or the **image** of  $x$  under  $f$ . We may also say that  $f$  **maps**  $x$  to  $y$ .

Using diagram

DEFINITION 2. Two functions  $f$  and  $g$  are **equal** if they have the same domain and the same codomain and if  $f(x) = g(x)$  for all  $x$  in domain.

DEFINITION 3. The **graph** of  $f : X \rightarrow Y$  is the set

$$G_f = \{(x, y) \in X \times Y \mid y = f(x)\}.$$

- We can determine a function from its domain, codomain, and graph.
- We can describe a function by formula, by listing its values, or by words.

EXAMPLE 4. Let  $X = \{2, 4, 6\}$  and  $Y = \{a, b, c, d\}$ . Determine in which of the following cases,  $f$  is function from  $X$  to  $Y$ .

(a)  $f(2) = b, f(4) = a, f(6) = d$

(b)  $f(2) = c, f(4) = c, f(6) = c$

(c)  $f(2) = a, f(4) = b, f(6) = c, f(4) = d$

(d)  $f(2) = c, f(6) = d$

**Some common functions**

- **Identity** function  $I_X : X \rightarrow X$  maps every element to itself:
  
- **Polynomial** of degree  $n$  with real coefficients  $a_0, a_1, \dots, a_n$  is a function from  $\mathbb{R}$  to  $\mathbb{R}$

Polynomials of degrees 0,1,2,3 are constant, linear, quadratic, cubic, respectively.

EXAMPLE 5. Let  $f : X \rightarrow Y$  be defined by  $f(x) = x^3 + 3$ . In each of the following cases find its graph and illustrate it .

(a)  $X = Y = \mathbb{R}$

(b)  $X = \{-1, 0, 1\}, Y = \mathbb{R}$

**Range (or Image) of a Function**

DEFINITION 6. Let  $f : X \rightarrow Y$  be a function. The **range** of  $f$  (also called the **image** of  $f$ ) is the set

$$\{y \in Y \mid y = f(x) \text{ for some } x \in X\}.$$

We denote the range (or image) of the function  $f$  by  $\text{ran } f$  (or  $\text{Im } f$ ).

EXAMPLE 7. Let  $f : X \rightarrow Y$  be a function. Using symbols complete the following

- $\text{ran } f \subseteq$  \_\_\_\_\_
- $\forall y \in Y, y \in \text{ran } f \Leftrightarrow$  \_\_\_\_\_
- $y \notin \text{ran } f \Leftrightarrow$  \_\_\_\_\_

EXAMPLE 8.  $f : \mathbb{R} \rightarrow \mathbb{R}$  is defined by  $f(x) = \cos x$ . Find  $\text{ran } f$ .

EXAMPLE 9. Let  $f : [\frac{1}{3}, \infty) \rightarrow \mathbb{R}$  be defined by  $f(x) = \sqrt{3x - 1}$  and  $S = \{y \in \mathbb{R} \mid y \geq 0\}$ . Prove that  $\text{ran } f = S$ .

## 5.2 Composition of Functions

DEFINITION 10. Let  $A$ ,  $B$ , and  $C$  be nonempty sets, and let  $f : A \rightarrow B$ ,  $g : B \rightarrow C$ . We define a function

$$g \circ f : A \rightarrow C,$$

called the **composition** of  $f$  and  $g$ , by

$$(g \circ f)(a) =$$

Using diagram

EXAMPLE 11. Let  $A = \{1, 2, 3, 4\}$ ,  $B = \{a, b, c, d\}$ ,  $C = \{r, s, t, u, v\}$  and define the functions  $f : A \rightarrow B$ ,  $g : B \rightarrow C$  by their graphs:

$$G_f = \{(1, b), (2, d), (3, a), (4, a)\}, \quad G_g = \{(a, u), (b, r), (c, r), (d, s)\}.$$

Find  $g \circ f$ . What about  $f \circ g$ ?

EXAMPLE 12. Let  $f, g : \mathbb{R} \rightarrow \mathbb{R}$  be defined by  $f(x) = e^x$  and  $g(x) = x \sin x$ . Find  $f \circ g$  and  $g \circ f$ .

PROPOSITION 13. Let  $f : A \rightarrow B$ ,  $g : B \rightarrow C$ , and  $h : C \rightarrow D$ . Then

$$(h \circ g) \circ f = h \circ (g \circ f),$$

i.e. composition of functions is associative.

*Proof.*

## Section 5.3 Surjective (or onto) and Injective (or one-to-one) Functions

### Surjective functions (“onto”)

DEFINITION 14. Let  $f : X \rightarrow Y$  be a function. Then  $f$  is **surjective** (or a surjection) if the range of  $f$  coincides with its codomain, i.e.

$$\text{ran } f = Y.$$

Note: surjection is also called “onto”.

Proving surjection:

We know that for all  $f : X \rightarrow Y$ : \_\_\_\_\_

Thus, to show that  $f : X \rightarrow Y$  is a surjection it is sufficient to prove that \_\_\_\_\_

In other words,

to prove that  $f : X \rightarrow Y$  is a surjective function it is sufficient to show that \_\_\_\_\_

Question: How to disprove surjectivity?

EXAMPLE 15. Let  $f : \mathbb{R} \rightarrow \mathbb{R}$  and  $g : \mathbb{R} \rightarrow [0, \infty)$  defined by  $f(x) = g(x) = x^4$ . Determine whether the following are true

(a)  $\text{ran} f = \text{ran}(g)$

(b)  $f = g$

(c)  $f$  is surjective

(d)  $g$  is surjective

EXAMPLE 16. Prove that the function  $f : \mathbb{R} - \{2\} \rightarrow \mathbb{R} - \{3\}$  defined by  $f(x) = \frac{3x}{x-2}$  is surjective.

### Injective functions (“one to one”)

DEFINITION 17. Let  $f : X \rightarrow Y$  be a function. Then  $f$  is **injective** (or an **injection**) if whenever  $x_1, x_2 \in X$  and  $x_1 \neq x_2$ , we have  $f(x_1) \neq f(x_2)$ .

In other words,  $f$  is injective if and only if the ranges of every two distinct points in the domain of  $f$  are distinct.

EXAMPLE 18. Given  $X = \{1, 2, 3\}$  and  $Y = \{3, 4, 5\}$ . Determine whether the following functions are injective. Justify your answer.

(a)  $f : X \rightarrow Y$  defined by  $G_f = \{(1, 3), (2, 4), (3, 5)\}$

(b)  $g : X \rightarrow Y$  defined by  $G_g = \{(1, 5), (2, 4), (3, 4)\}$

Proving injection:

Let  $P(x_1, x_2) : x_1 \neq x_2$  and  $Q(x_1, x_2) : f(x_1) \neq f(x_2)$ .

Then by definition  $f$  is injective if \_\_\_\_\_.

Using contrapositive, we have \_\_\_\_\_.

In other words, to prove injection show that:

Question: How to disprove injectivity?

EXAMPLE 19. Prove or disprove injectivity of the following functions.

(a)  $f : \mathbb{R} \rightarrow \mathbb{R}$ ,  $f(x) = \sqrt[5]{x}$ .

(b)  $f : \mathbb{R} \rightarrow \mathbb{R}$ ,  $f(x) = x^4$ .

$$(c) f : \mathbb{Z} \rightarrow \mathbb{Z}, f(n) = \begin{cases} n/2 & \text{if } n \in \mathbb{E}, \\ 2n & \text{if } n \in \mathbb{O}. \end{cases}$$

$$(c) f : \mathbb{Z} \rightarrow \mathbb{Z}, f(n) = \begin{cases} n & \text{if } n \in \mathbb{E}, \\ 5n & \text{if } n \in \mathbb{O}. \end{cases}$$

Discussion Exercise.

- Must a strictly increasing or decreasing function be injective?

- Must an injective function be strictly increasing or decreasing?

EXAMPLE 20. Prove or disprove injectivity of the following functions. In each case,  $f : \mathbb{R} \rightarrow \mathbb{R}$ .

(a)  $f(x) = 3x^5 + 5x^3 + 2x + \pi$ .

(b)  $f(x) = x^{12} + x^8 - x^4 + 12$ .

### Bijjective functions

DEFINITION 21. A function that is both surjective and injective is called **bijjective** (or bijection.)

Complete the following.

•  $f$  is not bijjective  $\Leftrightarrow$  \_\_\_\_\_

•  $f$  is surjective  $\Leftrightarrow (\text{codom } f \subseteq \text{_____}) \Leftrightarrow (\forall y, y \in \text{codom } f \Rightarrow \text{_____}) \Leftrightarrow$

$\Leftrightarrow (\forall y, y \in \text{codom } f \Rightarrow \exists x \in \text{dom } f \text{_____}) \Leftrightarrow (\forall y \in \text{codom } f, \exists x \in \text{dom } f \text{_____})$

In other words,  $f$  is surjective if and only if every point in  $\text{codom } f$  has a preimage in the  $\text{dom } f$ .

If in addition  $f$  is injective, then we obtain

•  $f$  is bijjective  $\Leftrightarrow (\exists! x \in \text{dom } f \text{_____})$

In other words,  $f$  is bijjective if and only if every point in  $\text{codom } f$  has a unique preimage in the  $\text{dom } f$ .

EXAMPLE 22. Determine which of the following functions are bijjective.

(a)  $f : \mathbb{R} \rightarrow \mathbb{R}, f(x) = x^3$ .

(b)  $f : \mathbb{R} \rightarrow \mathbb{R}, f(x) = x^2$ .

PROPOSITION 23. *Let  $f : A \rightarrow B$  and  $g : B \rightarrow C$ . Then*

**i.** *If  $f$  and  $g$  are surjections, then  $g \circ f$  is also a surjection.*

*Proof.*

**ii.** *If  $f$  and  $g$  are injections, then  $g \circ f$  is also an injection.*

*Proof.*

COROLLARY 24. *If  $f$  and  $g$  are bijections, then  $g \circ f$  is also a bijection.*

PROPOSITION 25. Let  $f : X \rightarrow Y$ . Then  $f \circ I_X = f$  and  $I_Y \circ f = f$ .

## 5.4 Invertible Functions

### Inverse Functions

DEFINITION 26. Let  $f : X \rightarrow Y$  be a function. We say that  $f$  is **invertible** if there is a function  $g : Y \rightarrow X$  such that for all  $x \in X$  and for all  $y \in Y$ ,

$$y = f(x) \quad \Leftrightarrow \quad x = g(y).$$

We say that such a function  $g$  is an **inverse function** of  $f$ .

Question: What is the inverse of  $g$ ?

REMARK 27.  $f$  is invertible if and only if its inverse is invertible.

EXAMPLE 28. Show that the function  $f : \mathbb{R} - \{2\} \rightarrow \mathbb{R} - \{3\}$  defined by  $f(x) = \frac{3x}{x-2}$  is invertible and find its inverse function. (Note that the given function is bijective.)

PROPOSITION 29. *A function  $f : X \rightarrow Y$  is invertible if and only if there exists a function  $g : Y \rightarrow X$  such that*

$$g \circ f = I_X \quad \text{and} \quad f \circ g = I_Y.$$

PROPOSITION 30. *The inverse function is unique.*

**Proof.**

### **Notation**

When  $f : X \rightarrow Y$  is invertible, the unique inverse function is denoted by  $f^{-1}$ , and  $f^{-1} : Y \rightarrow X$ .

REMARK 31. Finding the inverse of a bijective function is not always possible by algebraic manipulations. For example,

if  $f(x) = e^x$  then  $f^{-1}(x) = \underline{\hspace{2cm}}$

The function  $f(x) = 3x^5 + 5x^3 + 2x + 2016$  is known to be bijective, but there is no way to find expression for its inverse.

THEOREM 32. *A function  $f : A \rightarrow B$  is invertible if and only if  $f$  is bijective.*

COROLLARY 33. *If a function  $f : A \rightarrow B$  is bijective, so is  $f^{-1}$ .*
