11.6: Vector Functions and Space Curves

A vector function is a function that takes one or more variables and returns a vector. Let $\mathbf{r}(t)$ be a vector function whose range is a set of 3-dimensional vectors:

$$\mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k},$$

where x(t), y(t), z(t) are functions of one variable and they are called the **component functions**.

A vector function $\mathbf{r}(t)$ is *continuous* if and only if its component functions x(t), y(t), z(t) are continuous.

EXAMPLE 1. Given

$$\mathbf{r}(t) = \langle t \ln(t+1), t^2 \sin t, e^t \rangle.$$

(a) Find the domain of $\mathbf{r}(t)$.

(b) Find all t where $\mathbf{r}(t)$ is continuous.

Space curve is given by parametric equations:

$$C = \{(x, y, z) | x = x(t), y = y(t), z = z(t), t \text{ in } I\},\$$

where I is an interval and t is a parameter.

FACT: Any continuous vector-function $\mathbf{r}(t)$ defines a space curve C that is traced out by the tip of the moving vector $\mathbf{r}(t)$.

Any parametric curve has a direction of motion given by increasing of parameter.

EXAMPLE 2. Describe the curve defined by the vector function (indicate direction of motion):

(a) $\mathbf{r}(t) = \langle \cos t, \sin t, 0 \rangle$

(b) $\mathbf{r}(t) = \langle \cos at, \sin at, c \rangle$ where a and c are positive constants.

(c) $\mathbf{r}(t) = \langle 2\cos t, 3\sin t, 1 \rangle, \ 0 \le t \le 2\pi$

(d) $\mathbf{r}(t)(x) = \langle \cos t, \sin t, t \rangle$

(e) $\mathbf{r}(t) = \langle 1 + t, 3 + 2t, 4 - 5t \rangle, \ 0 \le t \le -1.$

EXAMPLE 3. Show that the the curve given by

$$\mathbf{r}(t) = \left\langle \sin t, 2\cos t, \sqrt{3}\sin t \right\rangle$$

lies on both a plane and a sphere. Then conclude that its graph is a circle and find its radius.

Derivatives: The derivative \mathbf{r}' of a vector function \mathbf{r} is defined just as for a real-valued function:

$$\frac{\mathrm{d}\mathbf{r}(t_0)}{\mathrm{d}t} = \mathbf{r}'(t_0) = \lim_{h \to 0} \frac{\mathbf{r}(t_0 + h) - \mathbf{r}(t_0)}{h}$$

if the limit exists. The derivative $\mathbf{r}'(t_0)$ is the tangent vector to the curve $\mathbf{r}(t)$ at the point $\mathbf{r}(t_0) = \langle x(t_0), y(t_0), z(t_0) \rangle$.

THEOREM 4. If the functions x(t), y(t), z(t) are differentiable, then

$$\mathbf{r}'(t) = \langle x'(t), y'(t), z'(t) \rangle = x'(t)\mathbf{i} + y'(t)\mathbf{j} + z'(t)\mathbf{k}.$$

EXAMPLE 5. Given $\mathbf{r}(t) = (1+t)^2 \mathbf{i} + e^t \mathbf{j} + \sin 3t \mathbf{k}$.

- (a) Find $\mathbf{r}'(t)$
- (b) Find a tangent vector to the curve at t = 0.
- (c) Find a tangent line to the curve at t = 0.

(c) Find a tangent line to the curve at the point < 1, 1, 0 >.
