# HOW FAR IS AN ULTRAFLAT SEQUENCE OF UNIMODULAR POLYNOMIALS FROM BEING CONJUGATE-RECIPROCAL? 

TAmÁs ERdÉLYI

#### Abstract

In this paper we study ultraflat sequences $\left(P_{n}\right)$ of unimodular polynomials $P_{n} \in \mathcal{K}_{n}$ in general, not necessarily those produced by Kahane in his paper [Ka]. We examine how far is a sequence $\left(P_{n}\right)$ of unimodular polynomials $P_{n} \in \mathcal{K}_{n}$

 from being conjugate reciprocal. Our main results include the following.Theorem. Given a sequence $\left(\varepsilon_{n}\right)$ of positive numbers tending to 0, assume that $\left(P_{n}\right)$ is a $\left(\varepsilon_{n}\right)$-ultraflat sequence of unimodular polynomials $P_{n} \in \mathcal{K}_{n}$. The coefficients of $P_{n}$ are denoted by $a_{k, n}$, that is,

$$
P_{n}(z)=\sum_{k=0}^{n} a_{k, n} z^{k}, \quad, k=0,1, \ldots, n, \quad n=1,2, \ldots
$$

Then

$$
\sum_{k=0}^{n} k^{2}\left|a_{k, n}-\bar{a}_{n-k, n}\right|^{2} \geq\left(\frac{1}{3}+\delta_{n}\right) n^{3}
$$

where $\left(\delta_{n}\right)$ is a sequence of real numbers converging to 0 .

## 1. Introduction

Let $D$ be the open unit disk of the complex plane. Its boundary, the unit circle of the complex plane, is denoted by $\partial D$. Let

$$
\mathcal{K}_{n}:=\left\{p_{n}: p_{n}(z)=\sum_{k=0}^{n} a_{k} z^{k}, \quad a_{k} \in \mathbb{C},\left|a_{k}\right|=1\right\}
$$

The class $\mathcal{K}_{n}$ is often called the collection of all (complex) unimodular polynomials of degree $n$. Let

$$
\mathcal{L}_{n}:=\left\{p_{n}: p_{n}(z)=\sum_{k=0}^{n} a_{k} z^{k}, \quad a_{k} \in\{-1,1\}\right\}
$$

[^0]The class $\mathcal{L}_{n}$ is often called the collection of all (real) unimodular polynomials of degree $n$. By Parseval's formula,

$$
\int_{0}^{2 \pi}\left|P_{n}\left(e^{i t}\right)\right|^{2} d t=2 \pi(n+1)
$$

for all $P_{n} \in \mathcal{K}_{n}$. Therefore

$$
\begin{equation*}
\min _{z \in \partial D}\left|P_{n}(z)\right| \leq \sqrt{n+1} \leq \max _{z \in \partial D}\left|P_{n}(z)\right| \tag{1.1}
\end{equation*}
$$

An old problem (or rather an old theme) is the following.
Problem 1.1 (Littlewood's Flatness Problem). How close can a unimodular polynomial $P_{n} \in \mathcal{K}_{n}$ or $P_{n} \in \mathcal{L}_{n}$ come to satisfying

$$
\begin{equation*}
\left|P_{n}(z)\right|=\sqrt{n+1}, \quad z \in \partial D ? \tag{1.2}
\end{equation*}
$$

Obviously (1.2) is impossible if $n \geq 1$. So one must look for less than (1.2), but then there are various ways of seeking such an "approximate situation". One way is the following. In his paper [Li1] Littlewood had suggested that, conceivably, there might exist a sequence $\left(P_{n}\right)$ of polynomials $P_{n} \in \mathcal{K}_{n}$ (possibly even $P_{n} \in \mathcal{L}_{n}$ ) such that $(n+1)^{-1 / 2}\left|P_{n}\left(e^{i t}\right)\right|$ converge to 1 uniformly in $t \in \mathbb{R}$. We shall call such sequences of unimodular polynomials "ultraflat". More precisely, we give the following definition.

Definition 1.2. Given a positive number $\varepsilon$, we say that a polynomial $P_{n} \in \mathcal{K}_{n}$ is $\varepsilon$-flat if

$$
\begin{equation*}
(1-\varepsilon) \sqrt{n+1} \leq\left|P_{n}(z)\right| \leq(1+\varepsilon) \sqrt{n+1}, \quad z \in \partial D \tag{1.3}
\end{equation*}
$$

or equivalently

$$
\max _{z \in \partial D}| | P_{n}(z)|-\sqrt{n+1}| \leq \varepsilon \sqrt{n+1}
$$

Definition 1.3. Given a sequence $\left(\varepsilon_{n_{k}}\right)$ of positive numbers tending to 0 , we say that a sequence $\left(P_{n_{k}}\right)$ of unimodular polynomials $P_{n_{k}} \in \mathcal{K}_{n_{k}}$ is $\left(\varepsilon_{n_{k}}\right)$-ultraflat if

$$
\begin{equation*}
\left(1-\varepsilon_{n_{k}}\right) \sqrt{n_{k}+1} \leq\left|P_{n_{k}}(z)\right| \leq\left(1+\varepsilon_{n_{k}}\right) \sqrt{n_{k}+1}, \quad z \in \partial D \tag{1.4}
\end{equation*}
$$

or equivalently

$$
\max _{z \in \partial D}| | P_{n_{k}}(z)\left|-\sqrt{n_{k}+1}\right| \leq \varepsilon_{n_{k}} \sqrt{n_{k}+1}
$$

The existence of an ultraflat sequence of unimodular polynomials seemed very unlikely, in view of a 1957 conjecture of P. Erdős (Problem 22 in [Er]) asserting that, for all $P_{n} \in \mathcal{K}_{n}$ with $n \geq 1$,

$$
\begin{equation*}
\max _{z \in \partial D}\left|P_{n}(z)\right| \geq(1+\varepsilon) \sqrt{n+1} \tag{1.5}
\end{equation*}
$$

where $\varepsilon>0$ is an absolute constant (independent of $n$ ). Yet, refining a method of Körner [Kö], Kahane [Ka] proved that there exists a sequence $\left(P_{n}\right)$ with $P_{n} \in \mathcal{K}_{n}$ which is $\left(\varepsilon_{n}\right)$-ultraflat, where

$$
\begin{equation*}
\varepsilon_{n}=O\left(n^{-1 / 17} \sqrt{\log n}\right) \tag{1.5}
\end{equation*}
$$

Thus the Erdős conjecture (1.4) was disproved for the classes $\mathcal{K}_{n}$. For the more restricted class $\mathcal{L}_{n}$ the analogous Erdős conjecture is unsettled to this date. It is a common belief that the analogous Erdős conjecture for $\mathcal{L}_{n}$ is true, and consequently there is no ultraflat sequence of polynomials $P_{n} \in \mathcal{L}_{n}$.

An extension of Kahane's breakthrough is given in [Be]. For an account of some of the work done till the mid 1960's, see Littlewood's book [Li2] and [QS].

## 2. New Results

In this paper we study ultraflat sequences $\left(P_{n}\right)$ of unimodular polynomials $P_{n} \in$ $\mathcal{K}_{n}$ in general, not necessarily those produced by Kahane in his paper [Ka]. With trivial modifications our results remain valid even if we study ultraflat sequences $\left(P_{n_{k}}\right)$ of unimodular polynomials $P_{n_{k}} \in \mathcal{K}_{n_{k}}$. It is left to the reader to formulate these analogue results. We examine how far an ultraflat sequence ( $P_{n}$ ) of unimodular polynomials $P_{n} \in \mathcal{K}_{n}$ is from being conjugate reciprocal. Our main results are formulated by the following theorems. In each of Theorems $2.1-2.3$ we assume that $\left(\varepsilon_{n}\right)$ is a sequence of positive numbers tending to 0 , and the sequence $\left(P_{n}\right)$ of unimodular polynomials $P_{n} \in \mathcal{K}_{n}$ is $\left(\varepsilon_{n}\right)$-ultraflat.

If $Q_{n}$ is a polynomial of degree $n$ of the form

$$
Q_{n}(z)=\sum_{k=0}^{n} a_{k} z^{k}, \quad a_{k} \in \mathbb{C}
$$

then its conjugate polynomial is defined by

$$
Q_{n}^{*}(z):=z^{n} \bar{Q}_{n}(1 / z):=\sum_{k=0}^{n} \bar{a}_{n-k} z^{k}
$$

Theorem 2.1. We have

$$
\int_{\partial D}\left(\left|P_{n}^{\prime}(z)\right|-\left|P_{n}^{* \prime}(z)\right|\right)^{2}|d z|=2 \pi\left(\frac{1}{3}+\gamma_{n}\right) n^{3}
$$

where $\left(\gamma_{n}\right)$ is a sequence of real numbers converging to 0 .
Theorem 2.2. If the coefficients of $P_{n}$ are denoted by $a_{k, n}$, that is

$$
P_{n}(z)=\sum_{k=0}^{n} a_{k, n} z^{k}, \quad k=0,1, \ldots, n, \quad n=1,2, \ldots
$$

then

$$
\sum_{k=0}^{n} k^{2}\left|a_{k, n}-\bar{a}_{n-k, n}\right|^{2} \geq\left(\frac{1}{3}+\delta_{n}\right) n^{3}
$$

where $\left(\delta_{n}\right)$ is a sequence of real numbers converging to 0 .

Theorem 2.3. We have

$$
\int_{\partial D}\left|P_{n}(z)-P_{n}^{*}(z)\right|^{2}|d z| \geq 2 \pi\left(\frac{1}{3}+\gamma_{n}\right) n
$$

where $\left(\gamma_{n}\right)$ is a sequence of real numbers converging to 0 . Using the notation of Theorem 2.2, in terms of the coefficients of $P_{n}$, we have

$$
\sum_{k=0}^{n}\left|a_{k, n}-\bar{a}_{n-k, n}\right|^{2} \geq\left(\frac{1}{3}+\delta_{n}\right) n
$$

where $\left(\delta_{n}\right)$ is a sequence of real numbers converging to 0 .
Remark 2.4 Theorem 2.3 tells us much more than the non-existence of an ultraflat sequence of conjugate reciprocal unimodular polynomials. It measures how far such an ultraflat sequence is from being a sequence of conjugate reciprocal polynomials.

## 3. Lemmas

To prove the theorems in Section 2, we need two lemmas. The first one can be checked by a simple calculation.

Lemma 3.1. Let $P_{n}$ be an arbitrary polynomial of degree $n$ with complex coefficients having no zeros on the unit circle. Let

$$
f_{n}(z):=\frac{z P_{n}^{\prime}(z)}{P_{n}(z)} \quad \text { and } \quad f_{n}^{*}(z):=\frac{z P_{n}^{* \prime}(z)}{P_{n}^{*}(z)}
$$

Then

$$
\overline{f_{n}(z)}+f_{n}^{*}(z)=n, \quad z \in \partial D
$$

Our next lemma may be found in [MMR] (page 676) and is due to Malik.

Lemma 3.2. Let $P_{n}$ be an arbitrary polynomial of degree $n$ with complex coefficients. We have

$$
\max _{z \in \partial D}\left(\left|P_{n}^{\prime}(z)\right|+\left|P_{n}^{* \prime}(z)\right|\right) \leq n \max _{z \in \partial D}\left|P_{n}(z)\right|
$$

Lemma 3.3 (Bernstein's Inequality in $L_{2}(\partial D)$ ). If $Q_{n}$ is a polynomial of degree at most $n$ with complex coefficients, then

$$
\int_{\partial D}\left|Q_{n}^{\prime}(z)\right|^{2}|d z| \leq n^{2} \int_{\partial D}\left|Q_{n}(z)\right|^{2}|d z|
$$

## 4. Proof of the Theorems

Proof of Theorem 2.1. Lemma 3.2 combined with the ultraflatness of $\left(P_{n}\right)$ implies that

$$
\left|P_{n}^{\prime}(z)\right|+\left|P_{n}^{* \prime}(z)\right| \leq n \max _{z \in \partial D}\left|P_{n}(z)\right| \leq\left(1+\varepsilon_{n}\right)(n+1)^{3 / 2}
$$

for every $z \in \partial D$. Lemma 3.1 combined with the ultraflatness of $P_{n}$ imply

$$
\left|P_{n}^{\prime}(z)\right| \frac{1}{\left(1-\varepsilon_{n}\right) \sqrt{n+1}}+\left|P_{n}^{* \prime}(z)\right| \frac{1}{\left(1-\varepsilon_{n}\right) \sqrt{n+1}} \geq \frac{\left|P_{n}^{\prime}(z)\right|}{\left|P_{n}(z)\right|}+\frac{\left|P_{n}^{* \prime}(z)\right|}{\left|P_{n}^{*}(z)\right|} \geq n
$$

that is

$$
\left|P_{n}^{\prime}(z)\right|+\left|P_{n}^{* \prime}(z)\right| \geq\left(1-\varepsilon_{n}\right) n^{3 / 2}
$$

for every $z \in \partial D$. We conclude that

$$
\left(1-\varepsilon_{n}\right)^{2} n^{3} \leq\left(\left|P_{n}^{\prime}(z)\right|+\left|P_{n}^{* \prime}(z)\right|\right)^{2} \leq\left(1+\varepsilon_{n}\right)^{2}(n+1)^{3}, \quad z \in \partial D
$$

Multiplying the expression in the middle out and integrating on $\partial D$ with respect to $|d z|$, we obtain

$$
\begin{aligned}
2 \pi\left(1-\varepsilon_{n}\right)^{2} n^{3} & \leq \int_{\partial D}\left|P_{n}^{\prime}(z)\right|^{2}|d z|+\int_{\partial D}\left|P_{n}^{* \prime}(z)\right|^{2}|d z|+2 \int_{\partial D}\left|P_{n}^{\prime}(z) P_{n}^{* \prime}(z)\right||d z| \\
& \leq 2 \pi\left(1+\varepsilon_{n}\right)^{2} n^{3}
\end{aligned}
$$

Note that

$$
\begin{align*}
\int_{\partial D}\left|P_{n}^{\prime}(z)\right|^{2}|d z| & =\int_{\partial D}\left|P_{n}^{* \prime}(z)\right|^{2}|d z|=2 \pi \sum_{k=1}^{n} k^{2}  \tag{2.1}\\
& =2 \pi \frac{n(n+1)(2 n+1)}{6} \sim \frac{2 \pi}{3} n^{3}
\end{align*}
$$

Hence

$$
\int_{\partial D}\left|P_{n}^{\prime}(z)\right|\left|P_{n}^{* \prime}(z)\right||d z|=2 \pi\left(\frac{1}{6}+\delta_{n}\right) n^{3}
$$

with constants $\delta_{n}$ converging to 0 . Integrating the equation

$$
\left(\left|P_{n}^{\prime}(z)\right|-\left|P_{n}^{* \prime}(z)\right|\right)^{2}=\left|P_{n}^{\prime}(z)\right|^{2}+\left|P_{n}^{* \prime}(z)\right|^{2}-2\left|P_{n}^{\prime}(z) P_{n}^{* \prime}(z)\right|
$$

and using observation (2.1) we obtain the theorem.
Proof of Theorem 2.2. Parseval Formula and the triangle inequality give

$$
\begin{aligned}
2 \pi \sum_{k=0}^{n} k^{2}\left|a_{k, n}-\bar{a}_{n-k, n}\right|^{2} & =\int_{\partial D}\left|P_{n}^{\prime}(z)-P_{n}^{* \prime}(z)\right|^{2}|d z| \\
& \geq \int_{\partial D}\left(\left|P_{n}^{\prime}(z)\right|-\left|P_{n}^{* \prime}(z)\right|\right)^{2}|d z|
\end{aligned}
$$

and the theorem then follows from Theorem 2.1.

Proof of Theorem 2.3. Applying Theorem 2.1, the triangle inequality, and the Bernstein inequality in $L_{2}$ for $P_{n}-P_{n}^{*}$ (see Lemma 3.3), we obtain

$$
\begin{aligned}
2 \pi\left(\frac{1}{3}+\gamma_{n}\right) n^{3} & =\int_{\partial D}\left(\left|P_{n}^{\prime}(z)\right|-\left|P_{n}^{* \prime}(z)\right|\right)^{2}|d z| \leq \int_{\partial D}\left|P_{n}^{\prime}(z)-P_{n}^{* \prime}(z)\right|^{2}|d z| \\
& \leq n^{2} \int_{\partial D}\left|P_{n}(z)-P_{n}^{*}(z)\right|^{2}|d z|
\end{aligned}
$$

where $\left(\gamma_{n}\right)$ is a sequence of real numbers converging to 0 . Now the first part of the theorem follows after dividing by $n^{2}$. To see the second part we proceed as in the proof of Theorem 2.2 by using Parseval's formula.

## 5. Last Minute Addition.

The author seems to be able to prove the following.
Theorem 5.1 (Saffari's Orthogonality Conjecture). Assume that $\left(P_{n}\right)$ is an ultraflat sequence of unimodular polynomials $P_{n} \in \mathcal{K}_{n}$. Let

$$
P_{n}(z):=\sum_{k=0}^{n} a_{k, n} z^{k}
$$

Then

$$
\sum_{k=0}^{n} a_{k, n} a_{n-k, n}=o(n)
$$

Here, as usual, o( $n$ ) denotes a quantity for which $\lim _{n \rightarrow \infty} o(n) / n=0$.
The proof of this may appear in a later publication.
6. Acknowledgment. I thank Peter Borwein for many discussions related to the topic.
