   The parametric equation for the line is $(x, y, z) = (2 + 2t, 3 + 3t, 4 + 4t)$.

   Substitute into the plane: $(2 + 2t) + (3 + 3t) - (4 + 4t) = 2$  or  $1 + t = 2$.

   So $t = 1$ and $(x, y, z) = (4, 6, 8)$. So $x + y + z = 18$.

\]

\[
L = \int_0^1 |\vec{v}| \, dt = \int_0^1 (1 + 2t^2) \, dt = 3\left(t + \frac{2}{3}t^3\right) = \left[3t + 2t^3\right]_0^1 = 5
\]

9. A jet fighter flies along the parabola $z = x^2$ in the $xz$-plane toward increasing values of $x$. Then, . . .

HINT: There are no computations.

a. $\mathbf{N} = (0, 0, 1)$ at all times.
b. $\mathbf{N} = (0, 0, -1)$ at all times.
c. $\mathbf{N} = (1, 0, 1)$ at all times.
d. $\mathbf{B} = (0, 1, 0)$ at all times.
e. $\mathbf{B} = (0, -1, 0)$ at all times. Correct Choice

$\mathbf{T}$ points tangent to the parabola toward increasing $x$.

$\mathbf{N}$ points perpendicular to the parabola toward the inside which is basically up.

So $\mathbf{B} = \mathbf{T} \times \mathbf{N}$ points toward the negative $y$-direction by the RHR. So $\mathbf{B} = (0, -1, 0)$.

17. A cardboard box has length \( L = 50 \text{ cm} \), width \( W = 40 \text{ cm} \) and height \( H = 30 \text{ cm} \).

18. In a particular ideal gas the pressure, $P$, the temperature, $T$, and density, $\rho$, are related by $P = 10\rho T$.

Currently, the temperature is $T = 300^\circ K$ and decreasing at $2^\circ K/hr$

while the density is $\rho = 2 \times 10^{-4}$ gm/cm$^3$ and increasing at $4 \times 10^{-6}$ gm/cm$^3$/hr.

Find the current pressure. Is it increasing or decreasing and at what rate?

The pressure is $P = 10\rho T = 10(2 \times 10^{-4})(300) = 0.6$ atm. By the chain rule,

$$\frac{dP}{dt} = \frac{\partial P}{\partial \rho} \frac{d\rho}{dt} + \frac{\partial P}{\partial T} \frac{dT}{dt} = 10T \frac{d\rho}{dt} + 10\rho \frac{dT}{dt} = 10(300)(4 \times 10^{-6}) + 10(2 \times 10^{-4})(-2)$$

$$= 12 \times 10^{-3} - 4 \times 10^{-3} = 8 \times 10^{-3} \quad \text{increasing}$$
