Math $311 \quad$ Exam 2 Version B Spring 2015
Section 502 P. Yasskin

Points indicated. Show all work.

| 1 | $/ 15$ | 4 | $/ 27$ |
| ---: | ---: | ---: | ---: |
| 2 | $/ 38$ | 5 E.C. | $/ 10$ |
| 3 | $/ 25$ | Total | 1115 |

1. (15 points) Let $P_{5}$ be the vector space of polynomials of degree less than 5 .

Consider the subspace $V=\operatorname{Span}\left(v_{1}, v_{2}, v_{3}, v_{4}\right)$ where

$$
v_{1}=2+3 x^{2}, \quad v_{2}=x-3 x^{3}, \quad v_{3}=2-x+3 x^{4}, \quad v_{4}=x^{2}+x^{3}-x^{4}
$$

Find a basis for $V$ What is $\operatorname{dim} V$ ?
2. (38 points) Consider the vector space $V=\operatorname{Span}\left(\sin ^{2}(x), \cos ^{2}(x), \sin (x) \cos (x)\right)$ with the usual addition and scalar multiplication of functions. Two bases are:
$e_{1}=\sin ^{2}(x) \quad e_{2}=\cos ^{2}(x) \quad e_{3}=\sin (x) \cos (x) \quad$ and $\quad E_{1}=1 \quad E_{2}=\sin (2 x) \quad E_{3}=\cos (2 x)$
Note: You do NOT need to prove they are bases.
Hints: Here are some useful identities:
$\sin (2 x)=2 \sin (x) \cos (x), \quad \cos (2 x)=\cos ^{2}(x)-\sin ^{2}(x), \quad \sin ^{2}(x)=\frac{1-\cos (2 x)}{2}, \quad \cos ^{2}(x)=\frac{1+\cos (2 x)}{2}$
a. (5) Find the change of basis matrix $\underset{E \leftarrow e}{C}$ from the $e$ basis to the $E$ basis by using the identities.
b. (5) Find the change of basis matrix $\underset{e \leftarrow E}{C}$ from the $E$ basis to the $e$ basis by using the identities.
c. (2) Verify $\underset{E \leftarrow e}{C}$ and $\underset{e \leftarrow E}{C}$ are inverses.
d. (4) For the function $f=\cos (2 x)+4 \cos ^{2}(x)$, what are its components $(f)_{e}$ and $(f)_{E}$ ?
e. (5) Find the matrix $\underset{e \leftarrow e}{A}$ of the derivative operator $D=\frac{d}{d x}$ relative to the $e$ basis.
f. (5) Find the matrix $\underset{E \leftarrow E}{B}$ of the derivative operator $D=\frac{d}{d x}$ relative to the $E$ basis. Do NOT use the change of basis matrices.
g. (2) $A$ and $B$ are related by a similarity transformation: $B=S A S^{-1}$. What is $S$ ?
h. (3) What is $\operatorname{Im}(D)$ ? Give a basis. What is $\operatorname{dim}(\operatorname{Im}(D))$ ?

HINT: Let $f=a \cdot 1+b \cdot \sin (2 x)+c \cdot \cos (2 x)$.
i. (3) What is $\operatorname{Ker}(D)$ ? Give a basis. What is $\operatorname{dim}(\operatorname{Ker}(D))$ ?
j. (2) Is $D$ onto? Why or why not?
k. (2) Is $D$ 1-1? Why or why not?
3. (25 points) Consider the vector space $S$ of symmetric $2 \times 2$ matrices. The following are symmetric, biinear forms on $S$. Which one(s) are inner products? Why or why not? You do not need to check they are symmetic or bilinear, just that they are positive definite.
HINTS: Let $A=\left(\begin{array}{ll}a & b \\ b & d\end{array}\right)$. Compute $\langle A, A\rangle$. Look for perfect squares or complete the squares.
a. (9) $\langle A, B\rangle=\operatorname{tr}\left(A G B^{\top}\right) \quad$ where $\quad G=\left(\begin{array}{ll}1 & 1 \\ 1 & 1\end{array}\right)$
b. (8) $\langle A, B\rangle=\operatorname{tr}\left(A G B^{\top}\right) \quad$ where $\quad G=\left(\begin{array}{ll}4 & 1 \\ 1 & 1\end{array}\right)$
c. (8) $\langle A, B\rangle=\operatorname{tr}\left(A G B^{\top}\right) \quad$ where $\quad G=\left(\begin{array}{ll}1 & 3 \\ 3 & 1\end{array}\right)$
4. (27 points) Consider the vector space $S$ of symmetric $2 \times 2$ matrices with the inner product

$$
\langle A, B\rangle=\operatorname{tr}\left(A G B^{\top}\right) \quad \text { where } G=\left(\begin{array}{ll}
1 & 0 \\
0 & 4
\end{array}\right)
$$

a. (8) Find the angle between the matrices $A=\left(\begin{array}{ll}4 & 3 \\ 3 & 4\end{array}\right)$ and $B=\left(\begin{array}{ll}3 & 4 \\ 4 & 3\end{array}\right)$.
b. (19) $A$ basis for $S$ is $\quad V_{1}=\left(\begin{array}{ll}3 & 0 \\ 0 & 2\end{array}\right) \quad V_{2}=\left(\begin{array}{ll}3 & 2 \\ 2 & 2\end{array}\right) \quad V_{3}=\left(\begin{array}{cc}5 & 0 \\ 0 & -5\end{array}\right)$.

Apply the Gram-Schmidt Procedure to the $\left(V_{1}, V_{2}, V_{3}\right)$ basis to produce an orthogonal basis ( $W_{1}, W_{2}, W_{3}$ ) and an orthonormal basis ( $U_{1}, U_{2}, U_{3}$ ).
5. (10 points EC) Consider the vector space $V=\left(\mathbb{R}^{+}\right)^{2}=\left\{\left(x_{1}, x_{2}\right) \mid x_{1}>0\right.$ and $\left.x_{2}>0\right\}$ consisting of ordered pairs of positive numbers with addition and multiplication defined by

$$
\left(x_{1}, x_{2}\right) \oplus\left(y_{1}, y_{2}\right)=\left(x_{1} y_{1}, x_{2} y_{2}\right) \text { and } a \odot\left(x_{1}, x_{2}\right)=\left(x_{1}{ }^{a}, x_{2}^{a}\right)
$$

So vector addition is real number multiplication of corresponding components and scalar multiplication is real number exponentiation of each component. Note the zero vector is $\overrightarrow{0}=(1,1)$.
a. (5) Is $u_{1}=(1,3)$ and $u_{2}=(2,1)$ a basis? Why or why not?
b. (5) Is $v_{1}=(1,1)$ and $v_{2}=(2,1)$ a basis? Why or why not?
