MATH 304

Linear Algebra

Lecture 19:

Review for Test 1.

Topics for Test 1

Part I: Elementary linear algebra (Leon 1.1–1.4, 2.1–2.2)

- Systems of linear equations: elementary operations, Gaussian elimination, back substitution.
- Matrix of coefficients and augmented matrix. Elementary row operations, row echelon form and reduced row echelon form.
 - Matrix algebra. Inverse matrix.
- Determinants: explicit formulas for 2×2 and 3×3 matrices, row and column expansions, elementary row and column operations.

Topics for Test 1

Part II: Abstract linear algebra (Leon 3.1-3.4, 3.6)

- Vector spaces (vectors, matrices, polynomials, functional spaces).
- Subspaces. Nullspace, column space, and row space of a matrix.
 - Span, spanning set. Linear independence.
 - Basis and dimension.
 - Rank and nullity of a matrix.

Sample problems for Test 1

Problem 1 (15 pts.) Find a quadratic polynomial p(x) such that p(1) = 1, p(2) = 3, and p(3) = 7.

Problem 2 (25 pts.) Let
$$A = \begin{pmatrix} 1 & -2 & 4 & 1 \\ 2 & 3 & 2 & 0 \\ 2 & 0 & -1 & 1 \\ 2 & 0 & 0 & 1 \end{pmatrix}$$
.

- (i) Evaluate the determinant of the matrix A.
- (ii) Find the inverse matrix A^{-1} .

Problem 3 (20 pts.) Determine which of the following subsets of \mathbb{R}^3 are subspaces. Briefly explain.

- (i) The set S_1 of vectors $(x, y, z) \in \mathbb{R}^3$ such that xyz = 0.
- (ii) The set S_2 of vectors $(x, y, z) \in \mathbb{R}^3$ such that x + y + z = 0.
- (iii) The set S_3 of vectors $(x, y, z) \in \mathbb{R}^3$ such that $y^2 + z^2 = 0$.
- (iv) The set S_4 of vectors $(x,y,z)\in\mathbb{R}^3$ such that $y^2-z^2=0$.

Problem 4 (30 pts.) Let
$$B = \begin{pmatrix} 0 & -1 & 4 & 1 \\ 1 & 1 & 2 & -1 \\ -3 & 0 & -1 & 0 \\ 2 & -1 & 0 & 1 \end{pmatrix}$$
.

- (i) Find the rank and the nullity of the matrix B.
- (ii) Find a basis for the row space of B, then extend this basis to a basis for \mathbb{R}^4 .
- (iii) Find a basis for the nullspace of B.

Bonus Problem 5 (15 pts.) Show that the functions $f_1(x) = x$, $f_2(x) = xe^x$, and $f_3(x) = e^{-x}$ are linearly independent in the vector space $C^{\infty}(\mathbb{R})$.

Bonus Problem 6 (15 pts.) Let V be a finite-dimensional vector space and V_0 be a proper subspace of V (where proper means that $V_0 \neq V$). Prove that dim $V_0 < \dim V$.

Problem 1. Find a quadratic polynomial p(x) such that p(1) = 1, p(2) = 3, and p(3) = 7.

Let
$$p(x) = ax^2 + bx + c$$
. Then $p(1) = a + b + c$, $p(2) = 4a + 2b + c$, and $p(3) = 9a + 3b + c$.

The coefficients a, b, and c have to be chosen so that

$$\begin{cases} a+b+c=1, \\ 4a+2b+c=3, \\ 9a+3b+c=7. \end{cases}$$

We solve this system of linear equations using elementary operations:

$$\begin{cases} a+b+c=1 \\ 4a+2b+c=3 \\ 9a+3b+c=7 \end{cases} \iff \begin{cases} a+b+c=1 \\ 3a+b=2 \\ 9a+3b+c=7 \end{cases}$$

$$\iff \begin{cases} a+b+c=1\\ 3a+b=2\\ 9a+3b+c=7 \end{cases} \iff \begin{cases} a+b+c=1\\ 3a+b=2\\ 8a+2b=6 \end{cases}$$

$$\iff \begin{cases} a+b+c=1\\ 3a+b=2\\ 4a+b=3 \end{cases} \iff \begin{cases} a+b+c=1\\ 3a+b=2\\ a=1 \end{cases}$$

$$\iff \begin{cases} a+b+c=1\\ b=-1\\ a=1 \end{cases} \iff \begin{cases} c=1\\ b=-1\\ a=1 \end{cases}$$
Thus the desired polynomial is $p(x)=x^2-x+1$.

Thus the desired polynomial is p(x) = x + 1.

Problem 2. Let $A = \begin{pmatrix} 1 & -2 & 4 & 1 \\ 2 & 3 & 2 & 0 \\ 2 & 0 & -1 & 1 \\ 2 & 0 & 0 & 1 \end{pmatrix}$.

(i) Evaluate the determinant of the matrix A.

Subtract the 4th row of A from the 3rd row:

$$\begin{vmatrix} 1 & -2 & 4 & 1 \\ 2 & 3 & 2 & 0 \\ 2 & 0 & -1 & 1 \\ 2 & 0 & 0 & 1 \end{vmatrix} = \begin{vmatrix} 1 & -2 & 4 & 1 \\ 2 & 3 & 2 & 0 \\ 0 & 0 & -1 & 0 \\ 2 & 0 & 0 & 1 \end{vmatrix}.$$

Expand the determinant by the 3rd row:

$$\begin{vmatrix} 1 & -2 & 4 & 1 \\ 2 & 3 & 2 & 0 \\ 0 & 0 & -1 & 0 \\ 2 & 0 & 0 & 1 \end{vmatrix} = (-1) \begin{vmatrix} 1 & -2 & 1 \\ 2 & 3 & 0 \\ 2 & 0 & 1 \end{vmatrix}.$$

Expand the determinant by the 3rd column:

$$(-1) \begin{vmatrix} 1 & -2 & 1 \\ 2 & 3 & 0 \\ 2 & 0 & 1 \end{vmatrix} = (-1) \left(\begin{vmatrix} 2 & 3 \\ 2 & 0 \end{vmatrix} + \begin{vmatrix} 1 & -2 \\ 2 & 3 \end{vmatrix} \right) = -1.$$

Problem 2. Let
$$A = \begin{pmatrix} 1 & -2 & 4 & 1 \\ 2 & 3 & 2 & 0 \\ 2 & 0 & -1 & 1 \\ 2 & 0 & 0 & 1 \end{pmatrix}$$
.

(ii) Find the inverse matrix A^{-1} .

First we merge the matrix A with the identity matrix into one 4×8 matrix

$$(A \mid I) = \begin{pmatrix} 1 & -2 & 4 & 1 & 1 & 0 & 0 & 0 \\ 2 & 3 & 2 & 0 & 0 & 1 & 0 & 0 \\ 2 & 0 & -1 & 1 & 0 & 0 & 0 & 1 & 0 \\ 2 & 0 & 0 & 1 & 0 & 0 & 0 & 1 \end{pmatrix}.$$

Then we apply elementary row operations to this matrix until the left part becomes the identity matrix. Subtract 2 times the 1st row from the 2nd row: $\begin{pmatrix} 1 & -2 & 4 & 1 & 1 & 0 & 0 \end{pmatrix}$

$$\begin{pmatrix}
1 & -2 & 4 & 1 & 1 & 0 & 0 & 0 \\
0 & 7 & -6 & -2 & -2 & 1 & 0 & 0 \\
2 & 0 & -1 & 1 & 0 & 0 & 1 & 0 \\
2 & 0 & 0 & 1 & 0 & 0 & 0 & 1
\end{pmatrix}$$

Subtract 2 times the 1st row from the 3rd row:

$$\begin{pmatrix} 1 & -2 & 4 & 1 & 1 & 0 & 0 & 0 \\ 0 & 7 & -6 & -2 & -2 & 1 & 0 & 0 \\ 0 & 4 & -9 & -1 & -2 & 0 & 1 & 0 \\ 2 & 0 & 0 & 1 & 0 & 0 & 0 & 1 \end{pmatrix}$$

Subtract 2 times the 1st row from the 4th row:

$$\begin{pmatrix}
1 & -2 & 4 & 1 & 1 & 0 & 0 & 0 \\
0 & 7 & -6 & -2 & -2 & 1 & 0 & 0 \\
0 & 4 & -9 & -1 & -2 & 0 & 1 & 0 \\
0 & 4 & -8 & -1 & -2 & 0 & 0 & 1
\end{pmatrix}$$

Subtract 2 times the 4th row from the 2nd row:

$$\begin{pmatrix}
1 & -2 & 4 & 1 & 1 & 0 & 0 & 0 \\
0 & -1 & 10 & 0 & 2 & 1 & 0 & -2 \\
0 & 4 & -9 & -1 & -2 & 0 & 1 & 0 \\
0 & 4 & -8 & -1 & -2 & 0 & 0 & 1
\end{pmatrix}$$

Subtract the 4th row from the 3rd row:

$$\begin{pmatrix} 1 & -2 & 4 & 1 & 1 & 0 & 0 & 0 \\ 0 & -1 & 10 & 0 & 2 & 1 & 0 & -2 \\ 0 & 0 & -1 & 0 & 0 & 0 & 1 & -1 \\ 0 & 4 & -8 & -1 & -2 & 0 & 0 & 1 \end{pmatrix}$$

Add 4 times the 2nd row to the 4th row:

$$\begin{pmatrix}
1 & -2 & 4 & 1 & 1 & 0 & 0 & 0 \\
0 & -1 & 10 & 0 & 2 & 1 & 0 & -2 \\
0 & 0 & -1 & 0 & 0 & 0 & 1 & -1 \\
0 & 0 & 32 & -1 & 6 & 4 & 0 & -7
\end{pmatrix}$$

Add 32 times the 3rd row to the 4th row: $\begin{pmatrix} 1 & -2 & 4 & 1 & 1 & 0 & 0 & 0 \end{pmatrix}$

$$\begin{pmatrix}
1 & -2 & 4 & 1 & 1 & 0 & 0 & 0 \\
0 & -1 & 10 & 0 & 2 & 1 & 0 & -2 \\
0 & 0 & -1 & 0 & 0 & 0 & 1 & -1 \\
0 & 0 & 0 & -1 & 6 & 4 & 32 & -39
\end{pmatrix}$$

Add 10 times the 3rd row to the 2nd row:

$$\begin{pmatrix} 1 & -2 & 4 & 1 & 1 & 0 & 0 & 0 \\ 0 & -1 & 0 & 0 & 2 & 1 & 10 & -12 \\ 0 & 0 & -1 & 0 & 0 & 0 & 1 & -1 \\ 0 & 0 & 0 & -1 & 6 & 4 & 32 & -39 \end{pmatrix}$$

Add the 4th row to the 1st row:

$$\begin{pmatrix} 1 & -2 & 4 & 0 & 7 & 4 & 32 & -39 \\ 0 & -1 & 0 & 0 & 2 & 1 & 10 & -12 \\ 0 & 0 & -1 & 0 & 0 & 0 & 1 & -1 \\ 0 & 0 & 0 & -1 & 6 & 4 & 32 & -39 \end{pmatrix}$$

Add 4 times the 3rd row to the 1st row:

$$\begin{pmatrix}
1 & -2 & 0 & 0 & 7 & 4 & 36 & -43 \\
0 & -1 & 0 & 0 & 2 & 1 & 10 & -12 \\
0 & 0 & -1 & 0 & 0 & 0 & 1 & -1 \\
0 & 0 & 0 & -1 & 6 & 4 & 32 & -39
\end{pmatrix}$$

Subtract 2 times the 2nd row from the 1st row:

$$\begin{pmatrix}
1 & 0 & 0 & 0 & 3 & 2 & 16 & -19 \\
0 & -1 & 0 & 0 & 2 & 1 & 10 & -12 \\
0 & 0 & -1 & 0 & 0 & 0 & 1 & -1 \\
0 & 0 & 0 & -1 & 6 & 4 & 32 & -39
\end{pmatrix}$$

Multiply the 2nd, the 3rd, and the 4th rows by -1:

$$\begin{pmatrix}
1 & 0 & 0 & 0 & 3 & 2 & 16 & -19 \\
0 & 1 & 0 & 0 & -2 & -1 & -10 & 12 \\
0 & 0 & 1 & 0 & 0 & 0 & -1 & 1 \\
0 & 0 & 0 & 1 & -6 & -4 & -32 & 39
\end{pmatrix}$$

$$\begin{pmatrix} 1 & 0 & 0 & 0 & 3 & 2 & 16 & -19 \\ 0 & 1 & 0 & 0 & -2 & -1 & -10 & 12 \\ 0 & 0 & 1 & 0 & 0 & 0 & -1 & 1 \\ 0 & 0 & 0 & 1 & -6 & -4 & -32 & 39 \end{pmatrix} = (I \mid A^{-1})$$

Finally the left part of our 4×8 matrix is transformed into the identity matrix. Therefore the current right part is the inverse matrix of A. Thus

matrix of
$$A$$
. Thus
$$A^{-1} = \begin{pmatrix} 1 & -2 & 4 & 1 \\ 2 & 3 & 2 & 0 \\ 2 & 0 & -1 & 1 \\ 2 & 0 & 0 & 1 \end{pmatrix}^{-1} = \begin{pmatrix} 3 & 2 & 16 & -19 \\ -2 & -1 & -10 & 12 \\ 0 & 0 & -1 & 1 \\ -6 & -4 & -32 & 39 \end{pmatrix}.$$

Problem 2. Let $A = \begin{pmatrix} 1 & -2 & 4 & 1 \\ 2 & 3 & 2 & 0 \\ 2 & 0 & -1 & 1 \\ 2 & 0 & 0 & 1 \end{pmatrix}$.

(i) Evaluate the determinant of the matrix A.

Alternative solution: We have transformed A into the identity matrix using elementary row operations. These included no row exchanges and three row multiplications, each time by -1.

It follows that $\det I = (-1)^3 \det A$.

$$\implies$$
 det $A = -\det I = -1$.

Problem 3. Determine which of the following subsets of \mathbb{R}^3 are subspaces. Briefly explain.

A subset of \mathbb{R}^3 is a subspace if it is closed under addition and scalar multiplication. Besides, the subset must not be empty.

(i) The set S_1 of vectors $(x, y, z) \in \mathbb{R}^3$ such that xyz = 0.

$$(0,0,0)\in \mathcal{S}_1 \implies \mathcal{S}_1 \text{ is not empty.}$$

$$xyz = 0 \implies (rx)(ry)(rz) = r^3xyz = 0.$$

That is, $\mathbf{v} = (x, y, z) \in S_1 \implies r\mathbf{v} = (rx, ry, rz) \in S_1$.

Hence S_1 is closed under scalar multiplication.

However S_1 is not closed under addition.

Counterexample: (1,1,0) + (0,0,1) = (1,1,1).

Problem 3. Determine which of the following subsets of \mathbb{R}^3 are subspaces. Briefly explain.

A subset of \mathbb{R}^3 is a subspace if it is closed under addition and scalar multiplication. Besides, the subset must not be empty.

(ii) The set S_2 of vectors $(x, y, z) \in \mathbb{R}^3$ such that x + y + z = 0.

$$(0,0,0) \in S_2 \implies S_2$$
 is not empty.

 $x + y + z = 0 \implies rx + ry + rz = r(x + y + z) = 0.$

Hence S_2 is closed under scalar multiplication.

$$x + y + z = x' + y' + z' = 0 \implies$$

 $(x + x') + (y + y') + (z + z') = (x + y + z) + (x' + y' + z') = 0.$

That is,
$$\mathbf{v} = (x, y, z), \ \mathbf{v}' = (x', y', z') \in S_2$$

 $\implies \mathbf{v} + \mathbf{v}' = (x + x', y + y', z + z') \in S_2.$

Hence S_2 is closed under addition.

(iii) The set S_3 of vectors $(x, y, z) \in \mathbb{R}^3$ such that $y^2 + z^2 = 0$.

$$y^2 + z^2 = 0 \iff y = z = 0.$$

 S_3 is a nonempty set closed under addition and scalar multiplication.

(iv) The set S_4 of vectors $(x, y, z) \in \mathbb{R}^3$ such that $y^2 - z^2 = 0$.

 S_4 is a nonempty set closed under scalar multiplication. However S_4 is not closed under addition. Counterexample: (0,1,1)+(0,1,-1)=(0,2,0).

Problem 4. Let
$$B = \begin{pmatrix} 0 & -1 & 4 & 1 \\ 1 & 1 & 2 & -1 \\ -3 & 0 & -1 & 0 \\ 2 & -1 & 0 & 1 \end{pmatrix}$$
.

(i) Find the rank and the nullity of the matrix B.

The rank (= dimension of the row space) and the nullity (= dimension of the nullspace) of a matrix are preserved under elementary row operations. We apply such operations to convert the matrix B into row echelon form.

Interchange the 1st row with the 2nd row:

$$\rightarrow \begin{pmatrix} 1 & 1 & 2 & -1 \\ 0 & -1 & 4 & 1 \\ -3 & 0 & -1 & 0 \\ 2 & -1 & 0 & 1 \end{pmatrix}$$

Add 3 times the 1st row to the 3rd row, then subtract 2 times the 1st row from the 4th row:

$$\rightarrow \begin{pmatrix} 1 & 1 & 2 & -1 \\ 0 & -1 & 4 & 1 \\ 0 & 3 & 5 & -3 \\ 2 & -1 & 0 & 1 \end{pmatrix} \rightarrow \begin{pmatrix} 1 & 1 & 2 & -1 \\ 0 & -1 & 4 & 1 \\ 0 & 3 & 5 & -3 \\ 0 & -3 & -4 & 3 \end{pmatrix}$$

Multiply the 2nd row by -1:

$$\rightarrow \begin{pmatrix} 1 & 1 & 2 & -1 \\ 0 & 1 & -4 & -1 \\ 0 & 3 & 5 & -3 \\ 0 & -3 & -4 & 3 \end{pmatrix}$$

Add the 4th row to the 3rd row:

$$\rightarrow \begin{pmatrix} 1 & 1 & 2 & -1 \\ 0 & 1 & -4 & -1 \\ 0 & 0 & 1 & 0 \\ 0 & -3 & -4 & 3 \end{pmatrix}$$

Add 3 times the 2nd row to the 4th row:

$$\rightarrow \begin{pmatrix} 1 & 1 & 2 & -1 \\ 0 & 1 & -4 & -1 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & -16 & 0 \end{pmatrix}$$

Add 16 times the 3rd row to the 4th row:

$$\rightarrow \begin{pmatrix} 1 & 1 & 2 & -1 \\ 0 & 1 & -4 & -1 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}$$

Now that the matrix is in row echelon form, its rank equals the number of nonzero rows, which is 3. Since

(rank of
$$B$$
) + (nullity of B) = (the number of columns of B) = 4, it follows that the nullity of B equals 1.

Problem 4. Let
$$B = \begin{pmatrix} 0 & -1 & 4 & 1 \\ 1 & 1 & 2 & -1 \\ -3 & 0 & -1 & 0 \\ 2 & -1 & 0 & 1 \end{pmatrix}$$
.

(ii) Find a basis for the row space of B, then extend this basis to a basis for \mathbb{R}^4 .

The row space of a matrix is invariant under elementary row operations. Therefore the row space of the matrix B is the same as the row space of its row echelon form:

$$\begin{pmatrix} 0 & -1 & 4 & 1 \\ 1 & 1 & 2 & -1 \\ -3 & 0 & -1 & 0 \\ 2 & -1 & 0 & 1 \end{pmatrix} \rightarrow \begin{pmatrix} 1 & 1 & 2 & -1 \\ 0 & 1 & -4 & -1 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}.$$

The nonzero rows of the latter matrix are linearly independent so that they form a basis for its row space:

$$\mathbf{v}_1 = (1, 1, 2, -1), \ \mathbf{v}_2 = (0, 1, -4, -1), \ \mathbf{v}_3 = (0, 0, 1, 0).$$

To extend the basis $\mathbf{v}_1, \mathbf{v}_2, \mathbf{v}_3$ to a basis for \mathbb{R}^4 , we need a vector $\mathbf{v}_4 \in \mathbb{R}^4$ that is not a linear combination of $\mathbf{v}_1, \mathbf{v}_2, \mathbf{v}_3$.

It is known that at least one of the vectors $\mathbf{e}_1=(1,0,0,0)$, $\mathbf{e}_2=(0,1,0,0)$, $\mathbf{e}_3=(0,0,1,0)$, and $\mathbf{e}_4=(0,0,0,1)$ can be chosen as \mathbf{v}_4 .

In particular, the vectors $\mathbf{v}_1, \mathbf{v}_2, \mathbf{v}_3, \mathbf{e}_4$ form a basis for \mathbb{R}^4 . This follows from the fact that the 4 \times 4 matrix whose rows are these vectors is not singular:

$$\begin{vmatrix} 1 & 1 & 2 & -1 \\ 0 & 1 & -4 & -1 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{vmatrix} = 1 \neq 0.$$

Problem 4. Let
$$B = \begin{pmatrix} 0 & -1 & 4 & 1 \\ 1 & 1 & 2 & -1 \\ -3 & 0 & -1 & 0 \\ 2 & -1 & 0 & 1 \end{pmatrix}$$
.

(iii) Find a basis for the nullspace of B.

The nullspace of B is the solution set of the system of linear homogeneous equations with B as the coefficient matrix. To solve the system, we convert B to reduced row echelon form:

$$\rightarrow \begin{pmatrix} 1 & 1 & 2 & -1 \\ 0 & 1 & -4 & -1 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix} \rightarrow \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & -1 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}$$

$$\implies x_1 = x_2 - x_4 = x_3 = 0$$

General solution: $(x_1, x_2, x_3, x_4) = (0, t, 0, t) = t(0, 1, 0, 1)$.

Thus the vector (0, 1, 0, 1) forms a basis for the nullspace of B.

Bonus Problem 5. Show that the functions $f_1(x) = x$, $f_2(x) = xe^x$, and $f_3(x) = e^{-x}$ are linearly independent in the vector space $C^{\infty}(\mathbb{R})$.

The functions f_1, f_2, f_3 are linearly independent whenever the Wronskian $W[f_1, f_2, f_3]$ is not identically zero.

$$W[f_1, f_2, f_3](x) = \begin{vmatrix} f_1(x) & f_2(x) & f_3(x) \\ f'_1(x) & f'_2(x) & f'_3(x) \\ f''_1(x) & f''_2(x) & f''_3(x) \end{vmatrix} = \begin{vmatrix} x & xe^x & e^{-x} \\ 1 & e^x + xe^x & -e^{-x} \\ 0 & 2e^x + xe^x & e^{-x} \end{vmatrix}$$
$$= e^{-x} \begin{vmatrix} x & xe^x & 1 \\ 1 & e^x + xe^x & -1 \\ 0 & 2e^x + xe^x & 1 \end{vmatrix} = \begin{vmatrix} x & x & 1 \\ 1 & 1 + x & -1 \\ 0 & 2 + x & 1 \end{vmatrix}$$

$$= x \begin{vmatrix} 1+x & -1 \\ 2+x & 1 \end{vmatrix} - \begin{vmatrix} x & 1 \\ 2+x & 1 \end{vmatrix} = x(2x+3)+2 = 2x^2+3x+2.$$

The polynomial $2x^2 + 3x + 2$ is never zero.

Bonus Problem 5. Show that the functions $f_1(x) = x$, $f_2(x) = xe^x$, and $f_3(x) = e^{-x}$ are linearly independent in the vector space $C^{\infty}(\mathbb{R})$.

Alternative solution: Suppose that $af_1(x)+bf_2(x)+cf_3(x)=0$ for all $x \in \mathbb{R}$, where a,b,c are constants. We have to show that a=b=c=0.

Let us differentiate this identity:

$$a + be^{x} + bxe^{x} - ce^{-x} = 0,$$

 $2be^{x} + bxe^{x} + ce^{-x} = 0,$
 $3be^{x} + bxe^{x} - ce^{-x} = 0,$
 $4be^{x} + bxe^{x} + ce^{-x} = 0.$

 $ax + bxe^{x} + ce^{-x} = 0$.

(the 5th identity)—(the 3rd identity): $2be^x = 0 \implies b = 0$. Substitute b = 0 in the 3rd identity: $ce^{-x} = 0 \implies c = 0$. Substitute b = c = 0 in the 2nd identity: a = 0.

Bonus Problem 5. Show that the functions $f_1(x) = x$, $f_2(x) = xe^x$, and $f_3(x) = e^{-x}$ are linearly independent in the vector space $C^{\infty}(\mathbb{R})$.

Alternative solution: Suppose that $ax + bxe^x + ce^{-x} = 0$ for all $x \in \mathbb{R}$, where a, b, c are constants. We have to show that a = b = c = 0.

For any $x \neq 0$ divide both sides of the identity by xe^x :

$$ae^{-x} + b + cx^{-1}e^{-2x} = 0.$$

The left-hand side approaches b as $x \to +\infty$. $\Longrightarrow b = 0$

Now $ax + ce^{-x} = 0$ for all $x \in \mathbb{R}$. For any $x \neq 0$ divide both sides of the identity by x:

$$a + cx^{-1}e^{-x} = 0.$$

The left-hand side approaches a as $x \to +\infty$. $\Longrightarrow a = 0$

Now $ce^{-x} = 0 \implies c = 0$.

Bonus Problem 6. Let V be a finite-dimensional vector space and V_0 be a proper subspace of V (where proper means that $V_0 \neq V$). Prove that dim $V_0 < \dim V$.

Any vector space has a basis. Let $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_k$ be a basis for V_0 .

Vectors $\mathbf{v}_1, \mathbf{v}_2, \ldots, \mathbf{v}_k$ are linearly independent in V since they are linearly independent in V_0 . Therefore we can extend this collection of vectors to a basis for V by adding some vectors $\mathbf{w}_1, \ldots, \mathbf{w}_m$. As $V_0 \neq V$, we do need to add some vectors, i.e., $m \geq 1$.

Thus dim $V_0 = k$ and dim V = k + m > k.
