Linear Algebra

O

Lecture 9: Properties of determinants.

#### **Determinants**

**Determinant** is a scalar assigned to each square matrix.

Notation. The determinant of a matrix  $A = (a_{ij})_{1 \le i,j \le n}$  is denoted det A or

$$\begin{vmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{n1} & a_{n2} & \dots & a_{nn} \end{vmatrix}$$

**Principal property:** det  $A \neq 0$  if and only if a system of linear equations with the coefficient matrix A has a unique solution. Equivalently, det  $A \neq 0$  if and only if the matrix A is invertible.

### **Definition in low dimensions**

Definition. 
$$\det(a) = a$$
,  $\begin{vmatrix} a & b \\ c & d \end{vmatrix} = ad - bc$ ,  $\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = a_{11}a_{22}a_{33} + a_{12}a_{23}a_{31} + a_{13}a_{21}a_{32} - a_{13}a_{22}a_{31} - a_{12}a_{21}a_{33} - a_{11}a_{23}a_{32}$ .

$$+: \begin{pmatrix} * & * & * \\ * & * & * \\ * & * & * \end{pmatrix}, \begin{pmatrix} * & * & * \\ * & * & * \\ * & * & * \end{pmatrix}, \begin{pmatrix} * & * & * \\ * & * & * \\ * & * & * \end{pmatrix}.$$

$$-: \begin{pmatrix} * & * & * \\ * & * & * \\ * & * & * \end{pmatrix}, \begin{pmatrix} * & * & * \\ * & * & * \\ * & * & * \end{pmatrix}, \begin{pmatrix} * & * & * \\ * & * & * \\ * & * & * \end{pmatrix}.$$

#### **General definition**

The general definition of the determinant is quite complicated as there is no simple explicit formula.

There are several approaches to defining determinants.

**Approach 1 (original):** an explicit (but very complicated) formula.

**Approach 2 (axiomatic):** we formulate properties that the determinant should have.

**Approach 3 (inductive):** the determinant of an  $n \times n$  matrix is defined in terms of determinants of certain  $(n-1)\times(n-1)$  matrices.

 $\mathcal{M}_n(\mathbb{R})$ : the set of  $n \times n$  matrices with real entries.

**Theorem** There exists a unique function det :  $\mathcal{M}_n(\mathbb{R}) \to \mathbb{R}$  (called the *determinant*) with the following properties:

- if a row of a matrix is multiplied by a scalar r, the determinant is also multiplied by r;
- if we add a row of a matrix multiplied by a scalar to another row, the determinant remains the same;
- if we interchange two rows of a matrix, the determinant changes its sign;
  - $\det I = 1$ .

**Corollary 1** Suppose A is a square matrix and B is obtained from A applying elementary row operations. Then  $\det A = 0$  if and only if  $\det B = 0$ .

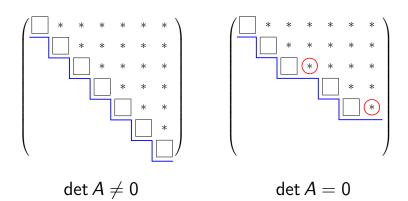

**Corollary 2**  $\det B = 0$  whenever the matrix B has a zero row.

Hint: Multiply the zero row by the zero scalar.

**Corollary 3** det A = 0 if and only if the matrix A is not invertible.

*Idea of the proof:* Let B be the reduced row echelon form of A. If A is invertible then B = I; otherwise B has a zero row.

### Row echelon form of a square matrix A:

Example. 
$$A = \begin{pmatrix} 3 & -2 & 0 \\ 1 & 0 & 1 \\ -2 & 3 & 0 \end{pmatrix}$$
,  $\det A = ?$ 

Earlier we have transformed the matrix A into the identity matrix using elementary row operations:

- interchange the 1st row with the 2nd row,
- add −3 times the 1st row to the 2nd row.
- add 2 times the 1st row to the 3rd row.
- multiply the 2nd row by -0.5,
- add −3 times the 2nd row to the 3rd row,
- multiply the 3rd row by -0.4,
- add -1.5 times the 3rd row to the 2nd row.
- add -1 times the 3rd row to the 1st row.

Example. 
$$A = \begin{pmatrix} 3 & -2 & 0 \\ 1 & 0 & 1 \\ -2 & 3 & 0 \end{pmatrix}$$
,  $\det A = ?$ 

Earlier we have transformed the matrix A into the identity matrix using elementary row operations.

These included two row multiplications, by -0.5 and by -0.4, and one row exchange.

It follows that

$$\det I = -(-0.5)(-0.4) \det A = (-0.2) \det A.$$

Hence  $\det A = -5 \det I = -5$ .

# Other properties of determinants

• If a matrix A has two identical rows then  $\det A = 0$ .

$$\begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ a_1 & a_2 & a_3 \end{vmatrix} = 0$$

• If a matrix A has two rows proportional then  $\det A = 0$ .

$$\begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ ra_1 & ra_2 & ra_3 \end{vmatrix} = r \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ a_1 & a_2 & a_3 \end{vmatrix} = 0$$

#### Distributive law for rows

• Suppose that matrices X, Y, Z are identical except for the *i*th row and the *i*th row of Z is the sum of the *i*th rows of X and Y.

Then  $\det Z = \det X + \det Y$ .

• Adding a scalar multiple of one row to another row does not change the determinant of a matrix.

$$\left| egin{array}{cccc} a_1+rb_1 & a_2+rb_2 & a_3+rb_3 \ b_1 & b_2 & b_3 \ c_1 & c_2 & c_3 \end{array} 
ight| =$$

$$= \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix} + \begin{vmatrix} rb_1 & rb_2 & rb_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix} = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}$$

Definition. A square matrix  $A = (a_{ij})$  is called **upper triangular** if all entries below the main diagonal are zeros:  $a_{ii} = 0$  whenever i > j.

• The determinant of an upper triangular matrix is equal to the product of its diagonal entries.

$$\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ 0 & a_{22} & a_{23} \\ 0 & 0 & a_{33} \end{vmatrix} = a_{11}a_{22}a_{33}$$

• If  $A = \operatorname{diag}(d_1, d_2, \dots, d_n)$  then  $\det A = d_1 d_2 \dots d_n$ . In particular,  $\det I = 1$ .

## **Determinant of the transpose**

• If A is a square matrix then  $\det A^T = \det A$ .

$$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}$$

#### Columns vs. rows

- If one column of a matrix is multiplied by a scalar, the determinant is multiplied by the same scalar.
- Interchanging two columns of a matrix changes the sign of its determinant.
- If a matrix A has two columns proportional then  $\det A = 0$ .
- Adding a scalar multiple of one column to another does not change the determinant of a matrix.

#### **Submatrices**

Definition. Given a matrix A, a  $k \times k$  submatrix of A is a matrix obtained by specifying k columns and k rows of A and deleting the other columns and rows.

$$\begin{pmatrix} 1 & 2 & 3 & 4 \\ 10 & 20 & 30 & 40 \\ 3 & 5 & 7 & 9 \end{pmatrix} \rightarrow \begin{pmatrix} * & 2 & * & 4 \\ * & * & * & * \\ * & 5 & * & 9 \end{pmatrix} \rightarrow \begin{pmatrix} 2 & 4 \\ 5 & 9 \end{pmatrix}$$

Given an  $n \times n$  matrix A, let  $M_{ij}$  denote the  $(n-1)\times(n-1)$  submatrix obtained by deleting the ith row and the jth column of A.

Example. 
$$A = \begin{pmatrix} 3 & -2 & 0 \\ 1 & 0 & 1 \\ -2 & 3 & 0 \end{pmatrix}$$
.

$$M_{11} = \begin{pmatrix} 0 & 1 \\ 3 & 0 \end{pmatrix}$$
,  $M_{12} = \begin{pmatrix} 1 & 1 \\ -2 & 0 \end{pmatrix}$ ,  $M_{13} = \begin{pmatrix} 1 & 0 \\ -2 & 3 \end{pmatrix}$ ,  $M_{21} = \begin{pmatrix} -2 & 0 \\ 3 & 0 \end{pmatrix}$ ,  $M_{22} = \begin{pmatrix} 3 & 0 \\ -2 & 0 \end{pmatrix}$ ,  $M_{23} = \begin{pmatrix} 3 & -2 \\ -2 & 3 \end{pmatrix}$ ,

 $M_{21} = \begin{pmatrix} 3 & 0 \end{pmatrix}$ ,  $M_{22} = \begin{pmatrix} -2 & 0 \end{pmatrix}$ ,  $M_{23} = \begin{pmatrix} -2 & 3 \end{pmatrix}$ ,  $M_{31} = \begin{pmatrix} -2 & 0 \\ 0 & 1 \end{pmatrix}$ ,  $M_{32} = \begin{pmatrix} 3 & 0 \\ 1 & 1 \end{pmatrix}$ ,  $M_{33} = \begin{pmatrix} 3 & -2 \\ 1 & 0 \end{pmatrix}$ .

### Row and column expansions

Given an  $n \times n$  matrix  $A = (a_{ij})$ , let  $M_{ij}$  denote the  $(n-1)\times(n-1)$  submatrix obtained by deleting the ith row and the jth column of A.

**Theorem** For any  $1 \le k, m \le n$  we have that

$$\det A = \sum_{j=1}^{n} (-1)^{k+j} a_{kj} \det M_{kj},$$
 (expansion by kth row)

$$\det A = \sum_{i=1}^{n} (-1)^{i+m} a_{im} \det M_{im}.$$
(expansion by mth column)

# Signs for row/column expansions

$$\begin{pmatrix} + & - & + & - & \cdots \\ - & + & - & + & \cdots \\ + & - & + & - & \cdots \\ - & + & - & + & \cdots \\ \vdots & \vdots & \vdots & \vdots & \ddots \end{pmatrix}$$

Example. 
$$A = \begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{pmatrix}$$
.

Expansion by the 1st row:

$$\begin{pmatrix} \boxed{1} & * & * \\ * & 5 & 6 \\ * & 8 & 9 \end{pmatrix} \quad \begin{pmatrix} * & \boxed{2} & * \\ 4 & * & 6 \\ 7 & * & 9 \end{pmatrix} \quad \begin{pmatrix} * & * & \boxed{3} \\ 4 & 5 & * \\ 7 & 8 & * \end{pmatrix}$$

 $\det A = 1 \begin{vmatrix} 5 & 6 \\ 8 & 9 \end{vmatrix} - 2 \begin{vmatrix} 4 & 6 \\ 7 & 9 \end{vmatrix} + 3 \begin{vmatrix} 4 & 5 \\ 7 & 8 \end{vmatrix}$ 

$$\det A = 1 \begin{vmatrix} 8 & 9 \end{vmatrix} - 2 \begin{vmatrix} 7 & 9 \end{vmatrix} + 3 \begin{vmatrix} 7 & 8 \end{vmatrix}$$

$$= (5 \cdot 9 - 6 \cdot 8) - 2(4 \cdot 9 - 6 \cdot 7) + 3(4 \cdot 8 - 5 \cdot 7) = 0.$$

Example. 
$$A = \begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{pmatrix}$$
.

Expansion by the 2nd column:

$$\begin{pmatrix} * & \boxed{2} & * \\ 4 & * & 6 \\ 7 & * & 9 \end{pmatrix} \quad \begin{pmatrix} 1 & * & 3 \\ * & \boxed{5} & * \\ 7 & * & 9 \end{pmatrix} \quad \begin{pmatrix} 1 & * & 3 \\ 4 & * & 6 \\ * & \boxed{8} & * \end{pmatrix}$$

 $\det A = -2 \begin{vmatrix} 4 & 6 \\ 7 & 9 \end{vmatrix} + 5 \begin{vmatrix} 1 & 3 \\ 7 & 9 \end{vmatrix} - 8 \begin{vmatrix} 1 & 3 \\ 4 & 6 \end{vmatrix}$ 

Example. 
$$A = \begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{pmatrix}$$
.

Subtract the 1st row from the 2nd row and from the 3rd row:

$$\begin{vmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{vmatrix} = \begin{vmatrix} 1 & 2 & 3 \\ 3 & 3 & 3 \\ 7 & 8 & 9 \end{vmatrix} = \begin{vmatrix} 1 & 2 & 3 \\ 3 & 3 & 3 \\ 6 & 6 & 6 \end{vmatrix} = 0$$

since the last matrix has two proportional rows.
