MATH 304, Section 510

Linear Algebra

Spring 2017

Instructor: Yaroslav Vorobets
Time: MWF 11:30 a.m. – 12:20 p.m.
Location: BLOC 163 (note the room change!)
Web page: `http://www.math.tamu.edu/~yvorobet/MATH304/`

Office: BLOC 223b (e-mail: `yvorobet@math.tamu.edu`)

Office hours: MWF 10:00-11:00 a.m. and by appointment.

Text: Steven J. Leon, *Linear Algebra with Applications*, 8th ed., Pearson Prentice Hall, Upper Saddle River, NJ, 2009 (`http://www.pearsonhighered.com/leon/`).

Prerequisites: Calculus II (MATH 148, MATH 152, or MATH 172), in particular, being familiar with analytic geometry and vectors; junior or senior classification.

Course content: see the next page.

Grading system: There will be 2 in-class tests and the final comprehensive exam. The tests are worth 90 points (or 22.5% of the final grade) each, the final exam is worth 120 points (or 30% of the final grade). Extra credit can be earned by solving bonus problems (on tests and the final exam). Also, there will be weekly quizzes (usually on Fridays), which will account for another 100 points (or 25% of the final grade).

The final grades will be assigned according to the 90–80–70–60% scale, that is, A for 360+ pts, B for 320–359 pts, C for 280–319 pts, D for 240–279 pts, and F for less than 240 pts.

The *tentative* dates for the two tests are March 1 and April 12. The final exam is scheduled for Tuesday, May 9, 10:30 a.m. – 12:30 p.m.

Make-ups: Make-ups for missed tests (and quizzes) will be allowed for a university approved excuse in writing. Wherever possible, inform the instructor before a test is missed. Consistent with University Student Rules, students are required to notify the instructor by the end of the next working day after missing a test. Otherwise, they forfeit their rights to a make-up.

Academic integrity: Copying another student's work is dishonest and academically worthless. Students are supposed to follow the Aggie Honor Code. Information about the Honor Council Rules and Procedures can be found at `http://aggiehonor.tamu.edu/`

Students with disabilities: The Americans with Disabilities Act (ADA) is a federal anti-discrimination statute that provides comprehensive civil rights protection for persons with disabilities. Among other things, this legislation requires that all students with disabilities be guaranteed a learning environment that provides for reasonable accommodation of their disabilities. If you believe you have a disability requiring an accommodation, please contact Disability Services, currently located in the Disability Services building at the Student Services at White Creek complex on west campus or call 845–1637. For additional information, visit `http://disability.tamu.edu/`

MATH 304, Section 510
Linear Algebra
Spring 2017

Course content: This is an introductory course in linear algebra covering the abstract concepts of vector space and linear transformation as well as some models and applications of these concepts to problems in the real world. The main topics to be covered are: systems of linear equations, matrices, determinants, vector spaces, linear transformations, orthogonality, eigenvalues and eigenvectors.

The emphasis of the course is on applications and problem solving. However the course also contains a substantial amount of abstract theory. The student should be able to do simple proofs.

Course outline

Part I ($\approx$ 3 weeks): *Elementary linear algebra*

- Systems of linear equations
- Gaussian elimination, Gauss-Jordan reduction
- Matrices, matrix algebra
- Determinants

Leon's book: Chapters 1–2

Part II ($\approx$ 4.5 weeks): *Abstract linear algebra*

- Vector spaces
- Linear independence
- Basis and dimension
- Coordinates, change of basis
- Linear transformations

Leon's book: Chapters 3–4

Part III ($\approx$ 4 weeks): *Advanced linear algebra*

- Orthogonality
- Inner products and norms
- The Gram-Schmidt orthogonalization process
- Eigenvalues and eigenvectors
- Diagonalization

Leon's book: Sections 5.1–5.6, 6.1, 6.3

Part IV ($\approx$ 2 weeks): *Topics in applied linear algebra*

- Matrix exponentials
- Rotations in space
- Orthogonal polynomials
- Markov chains

Leon's book: Chapters 5–6 (selected sections)
