Topics in Applied Mathematics I

# Lecture 4: Applications of systems of linear equations.

**MATH 311** 

Applications of systems of linear equations.

Matrix algebra.

# **Applications of systems of linear equations**

**Problem 1.** Find the point of intersection of the lines x - y = -2 and 2x + 3y = 6 in  $\mathbb{R}^2$ .

$$\begin{cases} x - y = -2 \\ 2x + 3y = 6 \end{cases}$$

**Problem 2.** Find the point of intersection of the planes x - y = 2, 2x - y - z = 3, and x + y + z = 6 in  $\mathbb{R}^3$ .

$$\begin{cases} x - y = 2 \\ 2x - y - z = 3 \\ x + y + z = 6 \end{cases}$$

Method of undetermined coefficients often involves solving systems of linear equations.

**Problem 3.** Find a quadratic polynomial p(x) such that p(1) = 4, p(2) = 3, and p(3) = 4.

Suppose that 
$$p(x) = ax^2 + bx + c$$
. Then  $p(1) = a + b + c$ ,  $p(2) = 4a + 2b + c$ ,  $p(3) = 9a + 3b + c$ .

$$\begin{cases} a+b+c = 4 \\ 4a+2b+c = 3 \\ 9a+3b+c = 4 \end{cases}$$

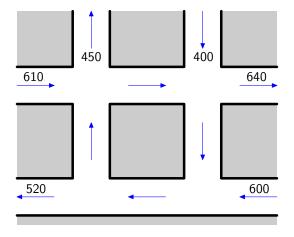

Method of undetermined coefficients often involves solving systems of linear equations.

**Problem 3.** Find a quadratic polynomial p(x) such that p(1) = 4, p(2) = 3, and p(3) = 4.

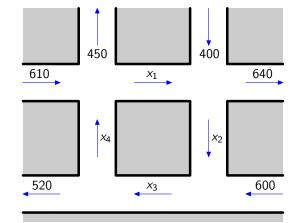

Alternative choice of coefficients: 
$$p(x) = \tilde{a} + \tilde{b}x + \tilde{c}x^2$$
.  
Then  $p(1) = \tilde{a} + \tilde{b} + \tilde{c}$ ,  $p(2) = \tilde{a} + 2\tilde{b} + 4\tilde{c}$ ,  $p(3) = \tilde{a} + 3\tilde{b} + 9\tilde{c}$ .

$$\begin{cases} \tilde{a} + b + \tilde{c} = 4 \\ \tilde{a} + 2\tilde{b} + 4\tilde{c} = 3 \\ \tilde{a} + 3\tilde{b} + 9\tilde{c} = 4 \end{cases}$$

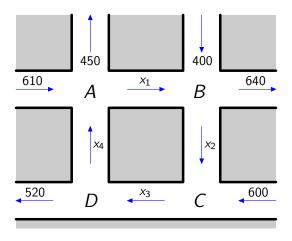

### **Traffic flow**

**Problem.** Determine the amount of traffic between each of the four intersections.

 $x_1 = ?$ ,  $x_2 = ?$ ,  $x_3 = ?$ ,  $x_4 = ?$ 

At each intersection, the incoming traffic has to match the outgoing traffic.

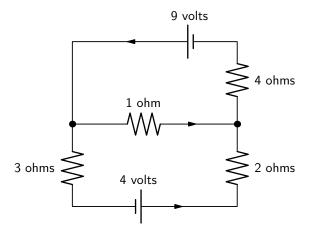

Intersection A: 
$$x_4 + 610 = x_1 + 450$$
  
Intersection B:  $x_1 + 400 = x_2 + 640$   
Intersection C:  $x_2 + 600 = x_3$   
Intersection D:  $x_3 = x_4 + 520$ 

$$\begin{cases} x_4 + 610 = x_1 + 450 \\ x_1 + 400 = x_2 + 640 \\ x_2 + 600 = x_3 \\ x_3 = x_4 + 520 \end{cases}$$

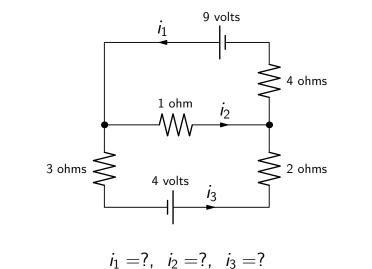

$$\iff \begin{cases} -x_1 + x_4 = -160 \\ x_1 - x_2 = 240 \\ x_2 - x_3 = -600 \\ x_3 - x_4 = 520 \end{cases}$$

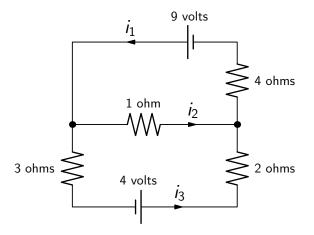

Intersection A.

#### **Electrical network**

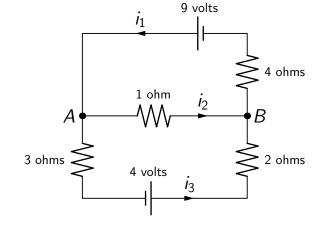

**Problem.** Determine the amount of current in each branch of the network.

Kirchhof's law #1 (junction rule): at every node the sum of the incoming currents equals the sum of the outgoing currents.

Node A: 
$$i_1 = i_2 + i_3$$
  
Node B:  $i_2 + i_3 = i_1$ 

#### **Electrical network**

**Kirchhof's law #2 (loop rule):** around every loop the algebraic sum of all voltages is zero.

**Ohm's law:** for every resistor the voltage drop E, the current i, and the resistance R satisfy E = iR.

Top loop:  $9 - i_2 - 4i_1 = 0$ Bottom loop:  $4 - 2i_3 + i_2 - 3i_3 = 0$ Big loop:  $4 - 2i_3 - 4i_1 + 9 - 3i_3 = 0$ 

*Remark.* The 3rd equation is the sum of the first two equations.

$$\begin{cases} i_1 = i_2 + i_3 \\ 9 - i_2 - 4i_1 = 0 \\ 4 - 2i_3 + i_2 - 3i_3 = 0 \end{cases}$$

$$\iff \begin{cases} i_1 - i_2 - i_3 = 0 \\ 4i_1 + i_2 = 9 \\ -i_2 + 5i_3 = 4 \end{cases}$$

#### **Matrices**

Definition. An m-by-n matrix is a rectangular array of numbers that has m rows and n columns:

$$\begin{pmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{pmatrix}$$

Notation:  $A = (a_{ij})_{1 \le i \le n, 1 \le j \le m}$  or simply  $A = (a_{ij})$  if the dimensions are known.

# Vector algebra

Let  $\mathbf{a} = (a_1, a_2, \dots, a_n)$  and  $\mathbf{b} = (b_1, b_2, \dots, b_n)$  be *n*-dimensional vectors, and  $r \in \mathbb{R}$  be a scalar.

Vector sum: 
$$\mathbf{a} + \mathbf{b} = (a_1 + b_1, a_2 + b_2, \dots, a_n + b_n)$$

Scalar multiple: 
$$r\mathbf{a} = (ra_1, ra_2, \dots, ra_n)$$

*Zero vector:* 
$$\mathbf{0} = (0, 0, ..., 0)$$

Negative of a vector: 
$$-\mathbf{b} = (-b_1, -b_2, \dots, -b_n)$$

Vector difference:

$$\mathbf{a} - \mathbf{b} = \mathbf{a} + (-\mathbf{b}) = (a_1 - b_1, a_2 - b_2, \dots, a_n - b_n)$$

Given *n*-dimensional vectors  $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_k$  and scalars  $r_1, r_2, \dots, r_k$ , the expression

$$r_1\mathbf{v}_1 + r_2\mathbf{v}_2 + \cdots + r_k\mathbf{v}_k$$

is called a **linear combination** of vectors  $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_k$ .

Also, *vector addition* and *scalar multiplication* are called **linear operations**.

# Matrix algebra

Definition. Let  $A = (a_{ij})$  and  $B = (b_{ij})$  be  $m \times n$  matrices. The **sum** A + B is defined to be the  $m \times n$  matrix  $C = (c_{ij})$  such that  $c_{ij} = a_{ij} + b_{ij}$  for all indices i, j.

That is, two matrices with the same dimensions can be added by adding their corresponding entries.

$$\begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \\ a_{31} & a_{32} \end{pmatrix} + \begin{pmatrix} b_{11} & b_{12} \\ b_{21} & b_{22} \\ b_{31} & b_{32} \end{pmatrix} = \begin{pmatrix} a_{11} + b_{11} & a_{12} + b_{12} \\ a_{21} + b_{21} & a_{22} + b_{22} \\ a_{31} + b_{31} & a_{32} + b_{32} \end{pmatrix}$$

*Definition.* Given an  $m \times n$  matrix  $A = (a_{ij})$  and a number r, the **scalar multiple** rA is defined to be the  $m \times n$  matrix  $D = (d_{ij})$  such that  $d_{ij} = ra_{ij}$  for all indices i, j.

That is, to multiply a matrix by a scalar r, one multiplies each entry of the matrix by r.

$$r\begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{pmatrix} = \begin{pmatrix} ra_{11} & ra_{12} & ra_{13} \\ ra_{21} & ra_{22} & ra_{23} \\ ra_{31} & ra_{32} & ra_{33} \end{pmatrix}$$

The  $m \times n$  **zero matrix** (all entries are zeros) is denoted  $O_{mn}$  or simply O.

**Negative** of a matrix: -A is defined as (-1)A. Matrix **difference**: A - B is defined as A + (-B).

As far as the *linear operations* (addition and scalar multiplication) are concerned, the  $m \times n$  matrices can be regarded as mn-dimensional vectors.

## **Examples**

$$A = \begin{pmatrix} 3 & 2 & -1 \\ 1 & 1 & 1 \end{pmatrix}, \quad B = \begin{pmatrix} 2 & 0 & 1 \\ 0 & 1 & 1 \end{pmatrix},$$
$$C = \begin{pmatrix} 2 & 0 \\ 0 & 1 \end{pmatrix}, \quad D = \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix}.$$

$$\frac{C = \begin{pmatrix} 0 & 1 \end{pmatrix}, \quad D = \begin{pmatrix} 0 & 1 \end{pmatrix}}{2}$$

$$A + B = \begin{pmatrix} 5 & 2 & 0 \\ 1 & 2 & 2 \end{pmatrix}, \qquad A - B = \begin{pmatrix} 1 & 2 & -2 \\ 1 & 0 & 0 \end{pmatrix},$$
 $2C = \begin{pmatrix} 4 & 0 \\ 0 & 2 \end{pmatrix}, \qquad 3D = \begin{pmatrix} 3 & 3 \\ 0 & 3 \end{pmatrix},$ 

$$2C + 3D = \begin{pmatrix} 7 & 3 \\ 0 & 5 \end{pmatrix}, \qquad A + D \text{ is not defined.}$$

# **Properties of linear operations**

$$(A + B) + C = A + (B + C)$$
  
 $A + B = B + A$   
 $A + O = O + A = A$   
 $A + (-A) = (-A) + A = O$ 

r(sA) = (rs)A

1 A = A

0A = O

r(A+B) = rA + rB

(r+s)A = rA + sA
