

## Section 6.4: Definite Integral

Example: The following data gives the speed of a car  $x$  seconds after the car starts to stop. Estimate the distance the car travels during this time period.

$x$ (seconds)	0	2	4	6	8
speed(ft/sec)	50	40	25	10	0

---

The marginal revenue, in millions of dollars per year, for a product is given in the table.

year	1990	1991	1992	1993	1994
rate	3.3	2.2	2.8	2.9	2.4

Approximate the revenue for this product from 1990-1993.

---

## Riemann Sums

Terminology:

$n$  = the number of rectangles

base of each rectangle =  $\frac{b-a}{n}$

$L_n$  is a left sum with  $n$  rectangles

$R_n$  is a right sum with  $n$  rectangles

$M_n$  is a midpoint sum with  $n$  rectangles

Example: Use the function  $f(x) = x^2 + 1$  on the interval  $[0, 2]$  to answer the following.

---

Definition: Let  $f(x)$  be a continuous function on  $[a, b]$ . The **definite integral** of  $f$  from  $a$  to  $b$  is defined and denoted in the following manner.

The **integrand** is  $f(x)$ , the **lower limit of the integral** is  $a$ , and the **upper limit of the integral** is  $b$ .

---

Example: Estimate  $\int_1^5 \ln(1 + x^2) dx$  using 4 rectangles.

---

### Properties of the definite integral

$$\int_a^a f(x) dx = 0$$

$$\int_a^b f(x) dx + \int_b^c f(x) dx = \int_a^c f(x) dx$$

$$\int_a^b f(x) dx = -\int_b^a f(x) dx$$

$$\int_a^b f(x) + g(x) dx = \int_a^b f(x) dx + \int_a^b g(x) dx$$

$$\int_a^b k * f(x) dx = k \int_a^b f(x) dx$$

Example: Use the fact that  $\int_a^b g(x) dx = 7$  and  $\int_a^b f(x) dx = 4$  to compute  $\int_a^b 5f(x) - 2g(x) dx =$

### Interpretations of the definite integral

If  $f(x) \geq 0$  on the interval  $[a, b]$  then  $\int_a^b f(x) dx$   
will represent \_\_\_\_\_

If  $f(x)$  is not entirely above the x-axis on the interval  $[a, b]$   
then  $\int_a^b f(x) dx$  will represent \_\_\_\_\_

Example: Use the graph of  $f(x)$  to answer these questions.

$$\int_0^A f(x) dx = \underline{\hspace{2cm}}$$

$$\int_A^B f(x) dx = \underline{\hspace{2cm}}$$

$$\int_C^B f(x) dx = \underline{\hspace{2cm}}$$

$$\int_A^C f(x) dx = \underline{\hspace{2cm}}$$

$$\int_0^C f(x) dx = \underline{\hspace{2cm}}$$

Find the area between  $f(x)$  and the  $x$ -axis from  $x = A$  to  $x = C$ .
