1. $\frac{3}{3+19}$
2. Mode $=4$ and 24

Median= 7
sample standard deviation $=7.843078$
Mean=11.42
population standard deviation $=7.76428$
population variance $=60.28351$
3. this is a conditional probability question.
we know the results of three questions ( 2 correct and one incorrect)
$\mathrm{n}=12-3=9$ so only 9 questions that are unknown.
$\mathrm{p}=0.25$
r (number of successes) $=6-2=4$
probability: $\operatorname{bpdf}(9,0.25,4)=.116798$
4. Think about the distribution on a number line. remember slow times are bigger numbers so they are on the right side of the number line.

| 0.15 | 0.2 | 0.30 | 0.35 |
| :---: | :---: | :---: | :---: |
| super fast | very fast | fast | slow |

the slowest time and still be in the very fast group is the break between very fast and fast.
invnorm $(0.15+0.2,19,3.5)=17.65$ minutes.
5. (a) $\sqrt{n p q}=\sqrt{42 * 0.4 * 0.6}$
(b) 20 failures is the same as 22 successes.
$\operatorname{bpdf}(42,0.4,22)=0.3305$
or
$\operatorname{bpdf}(42,0.6,20)=0.3305$
(c) $\operatorname{bcdf}(42,0.4,24)-\operatorname{bcdf}(42,0.4,12)=.90581$
6. solve $25+2.5 k=28.5$ and get $k=1.4$.
prob $\geq 1-\frac{1}{(1.4)^{2}}=0.489795$
7. (a) $300 * \operatorname{ncdf}(43,1 E 99,40,5)=300 * .27425=82.27859$
(b) 0 , since the random variable is continuous.
(c) $\mathrm{p}=\operatorname{ncdf}(37,47,40,5)=0.645$ $\operatorname{bcdf}(50,0.645,34)=0.74415$
8. Let A be the amount of the grand prize.

| X | $0-5=-5$ | $A-5$ | $4-5=-1$ |
| :---: | :---: | :---: | :---: |
| prob. | $\frac{2}{12} * \frac{2}{12}=\frac{1}{36}$ | $\frac{10}{12} * \frac{10}{12}=\frac{25}{36}$ | $1-\frac{1}{36}-\frac{25}{36}=\frac{10}{36}$ |

Now solve for $E(X)=-2$ and you get $A=68$ dollars.
9. $\mathrm{N}=52, \mathrm{I}=14, \mathrm{PV}=$ solve, $\mathrm{Pmt}=0, \mathrm{Fv}=400, \mathrm{P} / \mathrm{y}=\mathrm{C} / \mathrm{y}=52$

Answer: \$347.81
10. $\mathrm{N}=12, \mathrm{I}=5, \mathrm{PV}=-6000, \mathrm{Pmt}=400, \mathrm{Fv}=$ solve, $\mathrm{P} / \mathrm{y}=\mathrm{C} / \mathrm{y}=4$

Answer: 1820.38
11. step 1 find the payment.
$\mathrm{N}=40, \mathrm{I}=7.4, \mathrm{PV}=38500$, $\mathrm{Pmt}=$ solve $, \mathrm{Fv}=0, \mathrm{P} / \mathrm{y}=\mathrm{C} / \mathrm{y}=4$
payment $=1370.64$
Interest owed $=3850 * \frac{0.74}{4}=712.25$ done like the amortization charts.
Answer: $1370.64-712.25=658.39$
12. balance at end of 3rd year $(\mathrm{n}=12)$ - balance at start of third year $(\mathrm{n}=8)$ - any payments made in third year.
Ballance( $\mathrm{n}=12$ ): 3803.86
Ballance(n=8): 2813.06
payments made (in yr 3): $4^{*} 200=800$
Answer:3803.86-2813.06-800 $=190.80$
13. interest owed is $1400-1000=400$.
$\mathrm{I}=$ Prt gives $400=1000 r * 7$
solving for r gives $r=0.05714$
Answer: 5.714\%
14. First figure out the present value of each loan(what you owe.)

Loan 1: $\mathrm{N}=24, \mathrm{I}=7, \mathrm{PV}=$ solve, $\mathrm{Pmt}=-300, \mathrm{Fv}=0, \mathrm{P} / \mathrm{y}=\mathrm{C} / \mathrm{y}=4$ : still oew: 5838.21
Loan 2: $\mathrm{N}=144, \mathrm{I}=3, \mathrm{PV}=$ solve, $\mathrm{Pmt}=-400, \mathrm{Fv}=0, \mathrm{P} / \mathrm{y}=\mathrm{C} / \mathrm{y}=12$ : still owe: 48321.63
New loan: $\mathrm{N}=8^{*} 12, \mathrm{I}=5, \mathrm{PV}=54159.84$, $\mathrm{Pmt}=$ solve, $\mathrm{Fv}=0, \mathrm{P} / \mathrm{y}=\mathrm{C} / \mathrm{y}=12$
Answer: 685.66
15. first figure out how much needs to be in the account when Gabriel retires.
$\mathrm{N}=15^{*} 12, \mathrm{I}=5, \mathrm{PV}=$ solve, $\mathrm{Pmt}=4000, \mathrm{Fv}=0, \mathrm{P} / \mathrm{y}=\mathrm{C} / \mathrm{y}=12$ : needs 505820.97
now figure out the payments needed to save up for this amount.
$\mathrm{N}=40^{*} 12, \mathrm{I}=5, \mathrm{PV}=0 \mathrm{Pmt}=$ solve $, \mathrm{Fv}=505820.97, \mathrm{P} / \mathrm{y}=\mathrm{C} / \mathrm{y}=12$
Answer: 331.46
16. (a) $\mathrm{N}=12 * 30, \mathrm{I}=4, \mathrm{PV}=150000, \mathrm{Pmt}=$ solve, $\mathrm{Fv}=0, \mathrm{P} / \mathrm{y}=\mathrm{C} / \mathrm{y}=12$

Answer:716.12
(b) $\mathrm{N}=5^{*} 12, \mathrm{I}=4, \mathrm{PV}=150000, \mathrm{Pmt}=-716.12, \mathrm{Fv}=$ solve, $\mathrm{P} / \mathrm{y}=\mathrm{C} / \mathrm{y}=12$
after 5 years he still owes 135671.46
new value is $200000+1200 * 5=206,000$
Answer: 206,000-135,674.46 $=70,328.54$
(c) $\mathrm{N}=10^{*} 12, \mathrm{I}=4, \mathrm{PV}=150000, \mathrm{Pmt}=-716.12, \mathrm{Fv}=$ solve, $\mathrm{P} / \mathrm{y}=\mathrm{C} / \mathrm{y}=12$
after 10 years he still owes 118176.37
new loan is for $118,176.37+7000=125,176.37$
$\mathrm{N}=18^{*} 12, \mathrm{I}=3, \mathrm{PV}=125176.37, \mathrm{Pmt}=$ solve, $\mathrm{Fv}=0, \mathrm{P} / \mathrm{y}=\mathrm{C} / \mathrm{y}=12$
new loan payment is 750.71

## Check the back of the page for more problems.

paid on new loan: $750.71^{*} 12^{*} 18=162153.36$
paid on remaining old loan: $716.12^{*} 12^{*} 20=171868.80$
will save $171868.80-162153.36=9715.44$
so yes he should refinance.
