Vectors. The dot product

Let c be a scalar and
$$\vec{a} = \langle a_1, a_2 \rangle = a_1\vec{i} + a_2\vec{j}$$
 and
 $\vec{b} = \langle b_1, b_2 \rangle = b_1\vec{i} + b_2\vec{j}$ be vectors. Then
 $\vec{c}\vec{a} = \langle ca_1, ca_2 \rangle$
 $\vec{a} \pm \vec{b} = \langle a_1 \pm b_1, a_2 \pm b_2 \rangle$,
the **magnitude** of \vec{a} is $|\vec{a}| = \sqrt{a_1^2 + a_2^2}$,
vector $\vec{u} = \frac{1}{|\vec{a}|}\vec{a} = \left\langle \frac{a_1}{|\vec{a}|}, \frac{a_2}{|\vec{a}|} \right\rangle$ is a **unit vector** that has the same
direction as \vec{a} ,
the **dot product** of vectors \vec{a} and \vec{b} :
 $\vec{a} \cdot \vec{b} = |\vec{a}| |\vec{b}| \cos \theta = a_1 b_1 + a_2 b_2$,
the **scalar projection** of \vec{b} onto \vec{a} is a number $comp_{\vec{a}}\vec{b} = \left| \frac{\vec{a} \cdot \vec{b}}{|\vec{a}|} \right|$,
the **vector projection** of \vec{b} onto \vec{a} is a vector $proj_{\vec{a}}\vec{b} = \frac{\vec{a} \cdot \vec{b}}{|\vec{a}|^2}\vec{a}$.
Given the points $A(x_1, y_1)$ and $B(x_2, y_2)$, then
 $|\vec{AB} = \langle x_2 - x_1, y_2 - y_1 \rangle$.

Definition Given the nonzero vector $\vec{a} = \langle a_1, a_2 \rangle$, the **orthogonal complement** of \vec{a} is the vector $|\vec{a}^{\perp} = \langle -a_2, a_1 \rangle|$.

The distance from the point *P* to the line $L PQ = \operatorname{comp}_{\vec{AB}^{\perp}} \vec{AP}$

Example 1. Find the angle between vectors $\vec{a} = <3, 4>$ and $\vec{b} = <-1, 2>$.

<□ > < @ > < E > < E > E - のQ @

Example 1. Find the angle between vectors $\vec{a} = <3, 4 >$ and $\vec{b} = <-1, 2 >$.

Example 2. Find the distance between the line y = x and the point (0,1).

Vector equation of a line

A line *L* is determined by a point P_0 on *L* and a direction. Let \vec{v} be a vector parallel to line *L*. Let *P* be be an arbitrary point on *L* and let $\vec{r_0}$ and \vec{r} be the position vectors of *P* and P_0 . Then the **vector** equation of line *L* is

 $\vec{r}(t)=\vec{r_0}+t\vec{v}$.

If $\vec{r} = \langle x(t), y(t) \rangle$, $\vec{v} = \langle a, b \rangle$ and $P(x_0, y_0)$ then parametric equations of the line *L* are

$$x(t) = x_0 + at, y(t) = y_0 + bt$$

Example 3. Find a vector equation and parametric equations to the line that passes through the points $M_1(1, -2)$ and $M_2(2, 0)$.

Continuity. Vertical and horizontal asymptotes

Function f is **continuous at a number** a if $\lim_{x\to a} f(x) = f(a)$.

If f is not continuous at a, then f has **discontinuity** at a.

If $\lim_{x\to a^+} f(x) \neq \lim_{x\to a^-} f(x)$, then f has a jump discontinuity at a, if either $\lim_{x\to a^+} f(x) = \infty$ or $\lim_{x\to a^-} f(x) = \infty$, then f has an infinity discontinuity at a and we say line x = a is a vertical asymptote of the curve y = f(x). and if $\lim_{x\to a^+} f(x) = \lim_{x\to a^-} f(x) \neq f(a)$, then f has a removable discontinuity at a.

If $\lim_{x\to\infty} f(x) = b$, then we say line y = b is **horizontal asymptote** of the curve y = f(x).

Example 4. Find all vertical asymptotes of the curve $y = \frac{x+7}{x^2-49}$

Derivatives

Differentiation formulas

Suppose c is a constant and both functions f(x) and g(x) are differentiable.

(a)
$$(cf(x))' = cf'(x)$$
,
(b) $(f(x) + g(x))' = f'(x) + g'(x)$,
(c) $(f(x) - g(x))' = f'(x) - g'(x)$,
(d) $(f(x)g(x))' = f'(x)g(x) + f(x)g'(x)$.
(e) $\left(\frac{f(x)}{g(x)}\right)' = \frac{f'(x)g(x) - f(x)g'(x)}{g^2(x)}$.

The Chain Rule

If the derivatives g'(x) and f'(g(x)) both exist, and F(x)=f(g(x)), then F'(x) exist and F'(x) = f'(g(x))g'(x).

Slopes of parametric curves

Suppose that a curve C is given by the parametric equations

$$x = x(t), y = y(t), \text{ then } \left[\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} \right]$$

Example 5. A curve is given by the parametric equations $x(t) = t^3 - 1 + \ln t$, $y(t) = t^2$. Find the slope of the tangent line at t = 1.

Steps in logarithmic differentiation

◆□▶ ◆□▶ ◆ □▶ ★ □▶ = □ ● の < @

- 1. Take the logarithm of both sides of an equation.
- 2. Differentiate implicitly with respect to x.
- 3. Solve the resulting equation for y'.

Higher derivatives

$$f''(x) = [f'(x)]', f'''(x) = [f''(x)]', ..., f^{(n)}(x) = [f^{(n-1)}(x)]'$$

Example 7. Find $(\sin(2x))^{(2008)}$, i.e. the 2008-th derivative of $\sin(2x)$.

◆□▶ ◆□▶ ◆ □▶ ★ □▶ = □ ● の < @

Linear and quadratic approximations

The approximation $f(x) \approx f(a) + f'(a)(x-a)$ is called the **linear approximation** or **tangent line approximation** of f at a, and the function L(x) = f(a) + f'(a)(x-a) is called the **linearization** of f at a.

The quadratic approximation of f near a is $f(x) \approx f(a) + f'(a)(x-a) + \frac{f''(a)}{2}(x-a)^2.$

Example 8. Find the quadratic approximation to the function $f(x) = \sqrt{1+x}$ near 0.

Maximum and minimum values. Derivatives and the shapes of curves

A function f has an **absolute or global maximum** at c if $f(c) \ge f(x)$ for all x in the domain D of f. The number f(c) is called the **maximum value** of f on D.

A function f has an **absolute minimum** at c if $f(c) \le f(x)$ for all x in the domain D of f. The number f(c) is called the **minimum** value of f on D.

The maximum and minimum values are called the **extreme value** of f.

A function f has an **local or relative maximum** at c if $f(c) \ge f(x)$ for all x near c.

A function f has an **local minimum** at c if $f(c) \le f(x)$ for all x near c.

Fermat's Theorem

If f has a local min or max at c, and if f'(c) exists, then f'(c) = 0.

A **critical number** of a function f is a number c in the domain of f such that either f'(c) = 0 or f'(c) does not exist.

Increasing/decreasing test

(a) If f'(x) > 0 on an interval, then f is increasing on this interval. (b) If f'(x) > 0 on an interval, then f is increasing on this interval.

The first derivative test Suppose that c is a critical number of a continuous function f.

(a) If f' changes from positive to negative at c, then f has a local max at c.

(b) If f' changes from negative to positive at c, then f has a local min at c.

(c) If f' does not change sign c, then f has a no local max or min at c.

Example 9. Find and classify all critical points of the function $f(x) = 4x^3 - 9x^2 - 12x + 3$.

・ロト < 団ト < 三ト < 三ト < 回 < つへの

Example 9. Find and classify all critical points of the function $f(x) = 4x^3 - 9x^2 - 12x + 3$.

The closed interval method To find the absolute maximum and minimum values of a continuous function f on a closed interval [a, b]:

(a) Find the values of f at the critical numbers of f in (a, b)(b) Find f(a) and f(b)

(c) The largest number of the values from steps 1 and 2 is the absolute maximum value; the smallest of these values is the absolute minimum value.

A function is called **concave upward** (CU) on an interval I if f' is an increasing function on I. It is called **concave downward** (CD) on I if f' is an decreasing on I.

A point where a curve changes its direction of concavity is called an **inflection point**.

Concavity test

(a) If f''(x) > 0 on an interval, then f is CU on this interval. (b) If f''(x) < 0 on an interval, then f is CD on this interval.

The second derivative test Suppose f'' is continuous near c. (a) If f'(c) = 0 and f''(c) > 0, then f has a local min at c. (b) If f'(c) = 0 and f''(c) < 0, then f has a local max at c.

Example 10. Find the intervals of the concavity and the inflection point(s) of the function $f(x) = (1 + x^2)e^x$.

Applied maximum and minimum problems

Steps in solving applied max and min problems

- 1. Understand the problem.
- 2. Draw a diagram.

3. Introduce notation. Assign a symbol to the quantity that is to be minimized or maximized (let us call it Q). Also select symbols (a, b, c, \ldots, x, y) for other unknown quantities and label the diagram with these symbols.

4. Express Q in terms of some of the other symbols from step 3.
5. If Q has been expressed as a function of more than one variable in step 4, use the given information to find relationships (in the form of equation) among these variables. Then use these equations to eliminate all but one of the variables in the expression for Q. Thus, Q will be given as a function of one variable.
6. Find the **absolute** maximum or minimum of Q.

Example 11. A farmer with 1000 ft of fencing wants to enclose a rectangular area and then divide it into four pens with fencing parallel to one side of the rectangle. What is the largest possible total area of the four pens?

Indeterminate forms and L'Hospitale's rule

L'Hospital's Rule Suppose f and g are differentiable and $g'(x) \neq 0$ for points close to a (except, possibly a). Suppose that $\lim_{x \to a} f(x) = 0$ and $\lim_{x \to a} g(x) = 0$ or $\lim_{x \to a} f(x) = \infty$ and $\lim_{x \to a} g(x) = \infty$. Then

$$\lim_{x \to a} \frac{f(x)}{g(x)} = \left| \frac{0}{0} \text{ or } \frac{\infty}{\infty} \right| = \lim_{x \to a} \frac{f'(x)}{g'(x)}$$

Indeterminate products If $\lim_{x \to a} f(x) = \infty$ and $\lim_{x \to a} g(x) = 0$ or $\lim_{x \to a} f(x) = 0$ and $\lim_{x \to a} g(x) = \infty$, then $\lim_{x \to a} f(x)g(x) = |\infty \cdot 0| = \lim_{x \to a} \frac{f(x)}{1/g(x)} = \lim_{x \to a} \frac{g(x)}{1/f(x)} = \left| \frac{0}{0} \text{ or } \frac{\infty}{\infty} \right|$ and now we can use L'Hospital's Rule.

Indeterminate differences If we have to find $\lim_{x \to a} (f(x) - g(x)) = |\infty - \infty| (\lim_{x \to a} f(x) = \infty, \lim_{x \to a} g(x) = \infty),$ then we have to convert the difference into a quotient (by using a common denominator or rationalization, or factoring out a common factor) so that we have an indeterminate form of type $\left|\frac{0}{0} \text{ or } \frac{\infty}{\infty}\right|$ and we can use L'Hospital's Rule.

Indeterminate powers $\lim_{\substack{x \to a \\ x \to a}} [f(x)]^{g(x)} = |0^0 \text{ or } \infty^0 \text{ or } 1^\infty| = \lim_{x \to a} e^{g(x) \ln f(x)} = e^{\lim_{x \to a} [g(x) \ln f(x)]}$. Now let's find

$$\lim_{x \to a} [g(x) \ln f(x)] = |0 \cdot \infty| = \lim_{x \to a} \frac{\ln f(x)}{\frac{1}{g(x)}} = \left| \frac{0}{0} \text{ or } \frac{\infty}{\infty} \right| = b$$

Then $\lim_{x \to a} [f(x)]^{g(x)} = e^{b}$

◆□▶ ◆□▶ ◆ □▶ ★ □▶ = □ ● の < @

Example 12. Find each limit: (a) $\lim_{x \to 0} \frac{\tan x - \sin x}{x - \sin x}$ (b) $\lim_{x \to \infty} x^3 e^{-x^2}$ (c) $\lim_{x \to 0} (1 - 2x)^{1/x}$

◆□▶ ◆□▶ ◆三▶ ◆三▶ - 三 - のへぐ

Inverse functions

Definition A function f with domain A is called **one-to-one** function if $f(x_1) \neq f(x_2)$ whenever $x_1 \neq x_2$.

Horizontal line test A function is one-to-one if and only if no horizontal line intersects its graph more that once.

Definition Let f be one-to-one function with domain A and range B. Then its **inverse function** f^{-1} has domain B and range A and is defined by $f^{-1}(y) = x \iff f(x) = y$ for any y in B.

domain of f^{-1} = range of frange of f^{-1} = domain of f

Let *f* be one-to-one function with domain *A* and range *B*. If f(a) = b, then $f^{-1}(b) = a$. Cancellation equations $f^{-1}(f(x)) = x$ for every $x \in A$ $f(f^{-1}(x)) = x$ for every $x \in B$

How to find the inverse function of a one-to-one function f1. Write y = f(x)

- 2. Solve this equation for x in terms of y.
- 3. Interchange x and y. The resulting equation is $y = f^{-1}(x)$.

The graph of f^{-1} is obtained by the reflecting the graph f about the line y = x.

Theorem If *f* is a one-to-one differentiable function with inverse function $g = f^{-1}$ and $f'(g(a)) \neq 0$, then the inverse function is differentiable at *a* and $g'(a) = \frac{1}{f'(g(a))}$

Example 13. If $f(x) = x^7 + 3x + 1$ and $g = f^{-1}$, find g'(1).

(日) (周) (三) (三) (三) (○) (○)

Exponential function.

An **exponential function** is a function of the form $f(x) = a^x$ where *a* is a positive constant.

Theorem If a > 0 and $a \neq 1$, then $f(x) = a^x$ is continuous function with domain $(-\infty, \infty)$ and range $(0, \infty)$.

If 0 < a < 1, $f(x) = a^x$ is decreasing function

if a > 1, $f(x) = a^x$ is increasing function

If
$$a, b > 0$$
 and x, y are reals, then

$$1.a^{x+y} = a^{x}a^{y} \quad 2.a^{x-y} = \frac{a^{x}}{a^{y}} \quad 3.(a^{x})^{y} = a^{xy} \quad 4.(ab)^{x} = a^{x}b^{x}$$

If
$$0 < a < 1$$
, $\lim_{x \to -\infty} a^x = \infty$, $\lim_{x \to \infty} a^x = 0$
If $a > 1$, $\lim_{x \to -\infty} a^x = 0$, $\lim_{x \to \infty} a^x = \infty$
 $\boxed{\lim_{x \to 0} \frac{e^x - 1}{x} = 1}$, $e \approx 2.7283 > 1$

Logarithmic function

$$\log_a x = y \iff a^y = x$$

The cancellation equations

$$\log_a a^x = x$$
 $a^{\log_a x} = x$

Theorem Function $f(x) = \log_a x$ is one-to-one continuous function with domain $(0,\infty)$ and range $(-\infty,\infty)$. If a > 1, then $f(x) = \log_a x$ is increasing function, $\lim_{x \to \infty} \log_a x = \infty$ $\lim_{x\to 0^+}\log_{\textit{a}}x=-\infty$ if 0 < a < 1, then $f(x) = \log_a x$ is decreasing function, $\lim_{x \to \infty} \log_a x = -\infty$ $\lim_{x \to 0^+} \log_a x = \infty$

▲日▼ ▲□▼ ▲ □▼ ▲ □▼ ■ ● ● ●

 $\log_e x = \ln x$

If
$$x, y > 0$$
 and k is a constant, then
1. $\log_a xy = \log_a x + \log_a y$
2. $\log_a \frac{x}{y} = \log_a x - \log_a y$
3. $\log_a x^k = k \log_a x$
4. $\log_{a^k} x = \frac{1}{k} \log_a x$ $\log_{\frac{1}{a}} x = -\log_a x$
5. $\log_a a = 1$
6. $\log_a 1 = 0$
7. $\log_a x = \frac{\log_b x}{\log_b a}$

Example 15. $\cos \left[2 \sin^{-1} \left(\frac{5}{13}\right)\right] =$

Sigma notation

Definition If a_m , a_{m+1} , a_{m+2} ,..., a_n are real numbers and m and n are integers such that $m \le n$, then

$$a_m + a_{m+1} + a_{m+2} + \dots + a_n = \sum_{i=m}^n a_i$$

Theorem If c is any constant (this means that c does not depend on i), then

▲日▼ ▲□▼ ▲ □▼ ▲ □▼ ■ ● ● ●

(a)
$$\sum_{i=1}^{n} ca_i = c \sum_{i=1}^{n} a_i$$
 (b) $\sum_{i=1}^{n} (a_i \pm b_i) = \sum_{i=1}^{n} a_i \pm \sum_{i=1}^{n} b_i$
 $\sum_{i=1}^{n} 1 = n$ $\sum_{i=1}^{n} i = \frac{n(n+1)}{2}$ $\sum_{i=1}^{n} i^2 = \frac{n(n+1)(2n+1)}{6}$
 $\sum_{i=1}^{n} i^3 = \left[\frac{n(n+1)}{2}\right]^2$ $\sum_{i=1}^{n} i^4 = \frac{n(n+1)(2n+1)(3n^2+3n-1)}{30}$
Example 16. Compute $\sum_{i=1}^{20} i(i+2)$.

Antiderivative. Definite and indefinite integrals

Function F(x) is called an **antiderivative** of f(x) if F'(x) = f(x).

Then $\int f(x)dx = F(x) + C$ (indefinite integral=antiderivative)

Properties of indefinite integrals

1.
$$\int af(x)dx = a \int f(x)dx$$
,
2. $\int [f(x) + g(x)]dx = \int f(x)dx + \int g(x)dx$,
3. $\int [f(x) - g(x)]dx = \int f(x)dx - \int g(x)dx$.
A vector function $\vec{R}(t) = \langle X(t), Y(t) \rangle$ is called an
antiderivative of $\vec{r}(t) = \langle x(t), y(t) \rangle$ if $\vec{R'(t)} = \vec{r}(t)$: that is,
 $X'(t) = x(t)$ and $Y'(t) = y(t)$.

The fundamental theorem of calculus Suppose f is continuous on [a, b].

1. If
$$g(x) = \int_{a}^{x} f(t)dt$$
, then $g'(x) = f(x)$.
2. $\int_{a}^{b} f(x)dx = F(b) - F(a)$, where F is an antiderivative of f.

Properties of the definite integral

1.
$$\int_{a}^{b} cdx = c(b-a), \text{ where } c \text{ is a constant.}$$

2.
$$\int_{a}^{b} cf(x)dx = c \int_{a}^{b} f(x)dx, \text{ where } c \text{ is a constant.}$$

3.
$$\int_{a}^{b} [f(x) \pm g(x)]dx = \int_{a}^{b} f(x)dx \pm \int_{a}^{b} g(x)dx.$$

4.
$$\int_{a}^{b} f(x)dx = \int_{a}^{c} f(x)dx + \int_{c}^{b} f(x)dx, \text{ where } a < c < b.$$

5.
$$\int_{a}^{b} f(x)dx = -\int_{b}^{a} f(x)dx.$$

Ξ.

6. If
$$f(x) \ge 0$$
 for $a < x < b$, then $\int_{a}^{b} f(x)dx \ge 0$.
7. If $f(x) \ge g(x)$ for $a < x < b$, then $\int_{a}^{b} f(x)dx \ge \int_{a}^{b} g(x)dx$.
8. If $m \le f(x) \le M$ for $a < x < b$, then
 $m(b-a) \le \int_{a}^{b} f(x)dx \le M(b-a)$.
9. $\left| \int_{a}^{b} f(x)dx \right| \le \int_{a}^{b} |f(x)|dx$

Example 17. Find the area bounded by the graph of the function $y = x^3$, the *x*-axis, and the line x = 1.

6. If
$$f(x) \ge 0$$
 for $a < x < b$, then $\int_{a}^{b} f(x)dx \ge 0$.
7. If $f(x) \ge g(x)$ for $a < x < b$, then $\int_{a}^{b} f(x)dx \ge \int_{a}^{b} g(x)dx$.
8. If $m \le f(x) \le M$ for $a < x < b$, then
 $m(b-a) \le \int_{a}^{b} f(x)dx \le M(b-a)$.
9. $\left| \int_{a}^{b} f(x)dx \right| \le \int_{a}^{b} |f(x)|dx$

Example 17. Find the area bounded by the graph of the function $y = x^3$, the *x*-axis, and the line x = 1.

Example 18. A particle moves along a straight line and has acceleration given by $a(t) = t^2 - t$. Its initial velocity is v(0) = 2 cm/s and its initial displacement is s(0) = 1 cm. Find the position function s(t).

Example 19. Find the vector function $\vec{r}(t)$ that gives the position of a particle at time *t* having the acceleration $\vec{a}(t) = 2t\vec{i} + \vec{j}$, initial velocity $\vec{v}(0) = \vec{i} - \vec{j}$, and initial position (1,0).

The Substitution Rule

The substitution rule for indefinite integrals If u = g(x) is a differentiable function whose range is an interval I and f is continuous on I, then $\int f(g(x))g'(x)dx = \int f(u)du$

The substitution rule for definite integrals If g'(x) is continuous on [a, b] and f is continuous on the range of g, then

$$\int_{a}^{b} f(g(x))g'(x)dx = \int_{g(a)}^{g(b)} f(u)du$$

Example 20. Evaluate the integral
$$\int_{e}^{e^2} \frac{1}{t \ln^2 t} dt$$
.
