Table of indefinite integrals

1.
$$\int adx = ax + C$$
, a is a constant, 9. $\int \tan x dx = -\ln|\cos x| + C$,

2.
$$\int x dx = \frac{x^2}{2} + C$$
, 10. $\int \cot x dx = \ln|\sin x| + C$,

3.
$$\int x^n dx = \frac{x^{n+1}}{n+1} + C, n \neq -1,$$
 11. $\int \sec^2 x dx = \tan x + C,$

4.
$$\int \frac{1}{x} dx = \ln|x| + C$$
, 12. $\int \csc^2 x dx = -\cot x + C$,

$$5. \int e^x dx = e^x + C,$$

$$13. \int \sec x \tan x dx = \sec x + C,$$

$$6. \int a^x dx = \frac{a^x}{\ln a} + C, \qquad 14. \int \csc x \cot x = -\csc x + C,$$

$$7. \int \sin x dx = -\cos x + C, \qquad 15. \int \frac{1}{\sqrt{1-x^2}} dx = \arcsin x + C,$$

$$8. \int \cos x dx = \sin x + C, \qquad 16. \int \frac{1}{1+x^2} dx = \arctan x + C.$$

Definition of a definite integral

If f is a function defined on a closed interval [a, b], let P be a partition of [a, b] with partition points $x_0, x_1,...,x_n$, where

$$a = x_0 < x_1 < x_2 < \dots < x_n = b$$

Choose points $x_i^* \in [x_{i-1}, x_i]$ and let $\Delta x_i = x_i - x_{i-1}$ and $||P|| = \max\{\Delta x_i\}$. Then the **definite** integral of f from a to b is

$$\int_{a}^{b} f(x)dx = \lim_{\|P\| \to 0} \sum_{i=1}^{n} f(x_i^*) \Delta x_i$$

if this limit exists. If the limit does exist, then f is called **integrable** on the interval [a, b].

In the notation $\int_a^b f(x)dx$, f(x) is called the **integrand** and a and b are called the limits of integration; a is the **lower limit** and b is the **upper limit**.

The procedure of calculating an integral is called **integration**.

Properties of the definite integral

1.
$$\int_{-\infty}^{b} c dx = c(b-a)$$
, where c is a constant.

2.
$$\int_{a}^{b} cf(x)dx = c \int_{a}^{b} f(x)dx$$
, where c is a constant.

3.
$$\int_{a}^{b} [f(x) \pm g(x)] dx = \int_{a}^{b} f(x) dx \pm \int_{a}^{b} g(x) dx$$
.

4.
$$\int_{a}^{b} f(x)dx = \int_{a}^{c} f(x)dx + \int_{c}^{b} f(x)dx$$
, where $a < c < b$.

$$5. \int_{a}^{b} f(x)dx = -\int_{b}^{a} f(x)dx.$$

Section 6.4 The fundamental theorem of calculus.

Suppose f is continuous on [a, b].

1. If
$$g(x) = \int_a^x f(t)dt$$
, then $g'(x) = f(x)$.

2.
$$\int_{a}^{b} f(x)dx = F(b) - F(a) = F(x)|_{a}^{b}$$
, where F is an antiderivative of f.

Example 1. Evaluate the integral.

1.
$$\int_{2}^{6} \frac{1+\sqrt{y}}{y^2} dy$$

2.
$$\int_{0}^{2} f(x)dx, \text{ where } f(x) = \begin{cases} x^{4} & 0 \le x < 1 \\ x^{5} & 1 \le x \le 2 \end{cases}$$

Example 2. A particle moves along a line so that its velocity at time t is $v(t) = t^2 - 2t - 8$.

1. Find the displacement of the particle during the time period $1 \le t \le 6$.

2. Find the distance traveled during this time period.
