

Section 14.7 Maximum and minimum values.

**Definition.** A function of two variables has a **local maximum** at  $(a, b)$  if  $f(x, y) \leq f(a, b)$  for all points  $(x, y)$  in some disk with center  $(a, b)$ . The number  $f(a, b)$  is called a **local maximum value**. If  $f(x, y) \geq f(a, b)$  for all  $(x, y)$  in such a disk,  $f(a, b)$  is a **local minimum value**.

**Theorem.** If  $f$  has a local extremum (that is, a local maximum or minimum) at  $(a, b)$  and the first-order partial derivatives of  $f$  exist there, then

$$f_x(a, b) = f_y(a, b) = 0$$

**Geometric interpretation of the Theorem:** if the graph of  $f$  has a tangent plane at a local extremum, then the tangent plane must be horizontal.

A point  $(a, b)$  such that  $f_x(a, b) = f_y(a, b) = 0$  or one of these partial derivatives does not exist, is called a **critical point** of  $f$ . At a critical point, a function could have a local minimum or a local maximum or neither.

**Example 1.** Find the extreme values of  $f(x, y) = y^2 - x^2$ .

$$\begin{aligned} f_x(x, y) &= -2x = 0 \Rightarrow x = 0 \\ f_y(x, y) &= 2y = 0 \Rightarrow y = 0 \end{aligned} \quad \left. \begin{array}{l} \\ \\ \end{array} \right\} f(0,0) = 0.$$

Point  $(0,0)$

$$f(x,0) = -x^2 \leq 0, \quad f(x,0) \leq f(0,0) \text{ for all } x$$

$$f(0,y) = y^2 \geq 0, \quad f(0,y) \geq f(0,0) \text{ for all } y$$

$(0,0)$  is a saddle point.

**Second derivative test.** Suppose the second partial derivatives of  $f$  are continuous in a disk with center  $(a, b)$ , and suppose  $f_x(a, b) = f_y(a, b) = 0$ . Let

$$D = D(a, b) = \begin{vmatrix} f_{xx}(a, b) & f_{xy}(a, b) \\ f_{xy}(a, b) & f_{yy}(a, b) \end{vmatrix} = f_{xx}(a, b)f_{yy}(a, b) - [f_{xy}(a, b)]^2$$

- (a) If  $D > 0$  and  $f_{xx}(a, b) > 0$ , then  $f(a, b)$  is a **local minimum**.
  - (b) If  $D > 0$  and  $f_{xx}(a, b) < 0$ , then  $f(a, b)$  is a **local maximum**.
  - (c) If  $D < 0$ , then  $f(a, b)$  is not a local extremum.  $f(a, b)$  is a **saddle point**.
- If  $D = 0$  the test gives no information.

**Example 2.** Find the local extrema of  $f(x, y) = x^3 - 3xy + y^3$ .

$$\begin{aligned} f_x &= 3x^2 - 3y = 0 \\ f_y &= -3x + 3y^2 = 0 \end{aligned} \quad \left. \begin{array}{l} \\ \\ \end{array} \right\} \begin{array}{l} x^2 = y \\ x = y^2 \end{array}$$

$$\begin{aligned} x &= (x^2)^2 \text{ or } x = x^4 \\ x - x^4 &= 0 \\ x(1 - x^3) &= 0 \\ x = 0 \text{ or } x = 1 \\ y = 0^2 = 0 \quad y = 1^2 = 1 \end{aligned}$$

$$\begin{array}{l} f_{xx} = 6x \\ f_{xy} = -3 \\ f_{yy} = 6y \end{array}$$

Critical points  $(0,0)$  and  $(1,1)$ .

$$D = \begin{vmatrix} f_{xx} & f_{xy} \\ f_{xy} & f_{yy} \end{vmatrix} = \begin{vmatrix} 6x & -3 \\ -3 & 6y \end{vmatrix} = 36xy - 9$$

$$D(0,0) = -9 < 0$$

$(0,0)$  saddle point

$$D(1,1) = 36 - 9 = 27 > 0$$

$$f_{xx}(1,1) = 6 > 0$$

$(1,1)$  local min

**Example 3.** Find the points on the surface  $z^2 = xy + 1$  that are closest to the origin.

$(x, y, z)$  is an arbitrary point on the surface.

Distance from  $(x, y, z)$  to  $(0, 0, 0)$  is

$$d^2 = x^2 + y^2 + z^2$$

$$f(x, y) = d^2 = x^2 + y^2 + xy + 1$$

$$\frac{\partial f}{\partial x} = 2x + y = 0$$

$$y = -2x$$

$$\frac{\partial f}{\partial y} = 2y + x = 0$$

$$-3x = 0 \text{ or } x = 0 \text{ and } y = 0.$$

$(0, 0)$  is a critical point.

$$D = \begin{vmatrix} f_{xx} & f_{xy} \\ f_{xy} & f_{yy} \end{vmatrix} = \begin{vmatrix} 2 & 1 \\ 1 & 2 \end{vmatrix} = 4 - 1 = 3 > 0$$

$$f_{xx}(0, 0) = 2 > 0$$

$(0, 0)$  local min for  $x^2 + y^2 + xy + 1$   
 $z^2 = xy + 1$  if  $x = y = 0$ , then  $z^2 = 1$   
 $z = \pm 1$

$$\boxed{(0, 0, 1) \text{ and } (0, 0, -1)}$$

**Absolute maximum and minimum values.** A closed set in  $\mathbb{R}^2$  is one that contains all its boundary points. A bounded set in  $\mathbb{R}^2$  is one that is contained within some disk. Extreme value theorem for functions of two variables. If  $f$  is continuous on a closed, bounded set  $D$  in  $\mathbb{R}^2$ , then  $f$  attains an absolute maximum value  $f(x_1, y_1)$  and an absolute minimum value  $f(x_2, y_2)$  at some points  $(x_1, y_1)$  and  $(x_2, y_2)$  in  $D$ .

To find the absolute maximum and minimum values of a continuous function  $f$  on a closed bounded set  $D$ :

1. Find the values of  $f$  at the critical points of  $f$  in  $D$ .
2. Find the extreme values of  $f$  on the boundary of  $D$ .
3. The largest of the values of  $f$  from steps 1 and 2 is the absolute maximum value; the smallest of these values is the absolute minimum value.

2

**Example 4.** Find the absolute maximum and minimum values of the function  $f(x, y) = x^2 + y^2 + x^2y + 4$  on the set  $D = \{(x, y) \mid |x| \leq 1, |y| \leq 1\}$ .

Critical points of  $f$  inside  $D$ :

$$f_x = 2x + 2xy = 0 \Rightarrow 2x(1+y) = 0$$

$$f_y = 2y + x^2 = 0 \Rightarrow x^2 = -2y \text{ or } y = -1/2$$

Plug  $x=0$  into the 2nd equation:

$$2y = 0 \text{ or } y = 0$$

Point  $(0, 0)$

Plug  $y = -1/2$  into the 2nd equation:

$$x^2 = 2 \text{ or } x = \pm\sqrt{2}$$

Points  $(\pm\sqrt{2}, -1/2)$  - not in  $D$ .

Critical points on the boundary of  $D$ :

line  $x=1$   $f(1, y) = 1 + y^2 + y + 4 = y^2 + y + 5$

$$\frac{\partial f(1, y)}{\partial y} = 2y + 1 = 0, y = -1/2$$

Point  $(1, -1/2)$

line  $x=-1$   $f(-1, y) = 1 + y^2 + y + 4 = y^2 + y + 5$

Point  $(-1, -1/2)$

line  $y=1$   $f(x, 1) = x^2 + 1 + x^2 + 4 = 2x^2 + 5$

$$\frac{\partial f(x, 1)}{\partial x} = 4x = 0$$

Point  $(0, 1)$

line  $y=-1$   $f(x, -1) = x^2 + 1 - x^2 + 4 = 5$

no critical points.

$$f(0, 0) = 4 \text{ abs min value}$$

$$f(1, -1/2) = 1 + 1/4 - 1/2 + 4 = 5 - 1/4 = 19/4$$

$$f(-1, -1/2) = 19/4$$

$$f(0, 1) = 0 + 1 + 0 + 4 = 5 \text{ abs max value}$$
