## 2: SYSTEMS OF LINEAR EQUATIONS AND MATRICES

## 2.1: Systems of Linear Equations - Introduction

Given two lines $L_{1}$ and $L_{2}$ :

$$
\begin{aligned}
& L_{1}: a_{1} x+b_{1} y=c_{1} \\
& L_{2}: a_{2} x+b_{2} y=c_{2}
\end{aligned}
$$

One and only one of the following may occur:

| Lines | System |
| :---: | :---: |
| $L_{1}$ and $L_{2}$ intersect at exactly one point |  |
| $L_{1}$ and $L_{2}$ are parallel and coincident  <br> $y$  <br>   <br>   <br> 0 $x$ |  |
| $L_{1}$ and $L_{2}$ are parallel and distinct |  |

EXAMPLE 1. Solve:
(a) $\begin{aligned} & x+y=1 \\ & x-y=3\end{aligned}$
(b) $\begin{aligned} x+y & =1 \\ 2 x+2 y & =2\end{aligned}$
(c) $\begin{aligned} & x+y=1 \\ & x+y=2\end{aligned}$

A linear equation in 3 variables has the form

$$
a x+b y+c z=d,
$$

where $a, b, c$ not all 0 , and is a plane in the 3 -dimensional space.
Three planes can (a) intersect at one point, (b) intersect along a line, or (c) be parallel.
Regardless of how many variables are involved, any system of linear equations has either one, no, or infinitely many solutions.

SET UP the following world problems. Do not solve (yet). Be sure that the VARIABLES ARE DEFINED.

EXAMPLE 2. Mark has a total of $\$ 30,000$ invested in two municipal bonds that have yields of $8 \%$ and $10 \%$ interest per year, respectively. If the interest Mark receives from the bonds in a year is $\$ 2640$, how much does he have invested in each bond?

EXAMPLE 3. A store sells 29 sodas one afternoon. Suppose that the prices for small, medium, and large soda are $\$ 1.00, \$ 1.25$, and $\$ 1.40$, respectively, and that the total sales were $\$ 37.25$. If they sold three times as many large sodas as they did small sodas, how many large sodas did the store sell that afternoon?

EXAMPLE 4. A dietitian wishes to combine Baby Spinach, Baby Lettuces, and Radicchio. to make a 6-pound salad mixture. The caloric content per pound of Baby Spinach, Baby Lettuces and Radicchio is, respectively, 105, 75 and 99 calories. The units of Calcium per pound for each are 14,27 and 5 units respectively. If the dietitian wants the total caloric content to be 500 , and the total calcium units to be 120, how many pounds of each type of food should be used?

EXAMPLE 5. Desmond Jewelry wishes to produce 3 types of pendants: A, B and C.
To manufacture a type-A pendant requires 2 min on machines I and II and 3 min on machine III. A type-B pendant requires 2 min on machine I, 3 min on machine II and 4 min on machine III. A type-C pendant requires 3 min on machine I, 4 min on machine II and 3 min on machine III. There are $3 \frac{1}{2} h r$ available on machine I, $4 \frac{1}{2} h r$ available on machine II and $5 h r$ on machine III. How many pendants of each type should Desmond make in order to use the available time?

EXAMPLE 6. A theater has a seating capacity of 900 and charges $\$ 4$ for children, $\$ 6$ for students, and $\$ 8$ for adult. At a certain screening with full attendance, there were half as many adults as children and students combined. The receipts totaled $\$ 5600$, How many children attended the show?
