Section 2.5:Continuity

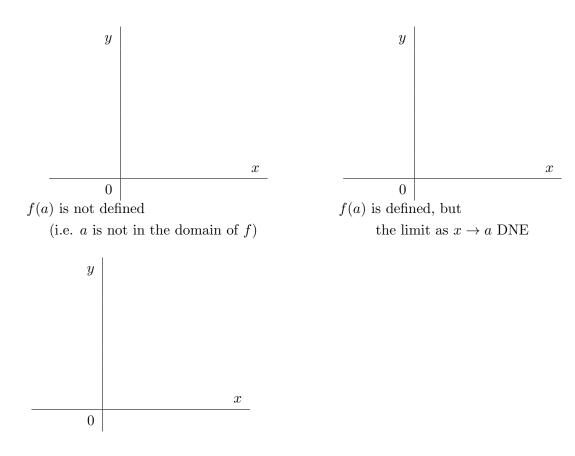

DEFINITION 1. A function f(x) is continuous at x = a if $\lim_{x \to a} f(x) = f(a)$. More implicitly: if f is continuous at a then

- 1. f(a) is defined (i.e. a is in the domain of f);
- 2. $\lim_{x \to a} f(x)$ exists.
- 3. $\lim_{x \to a} f(x) = f(a).$

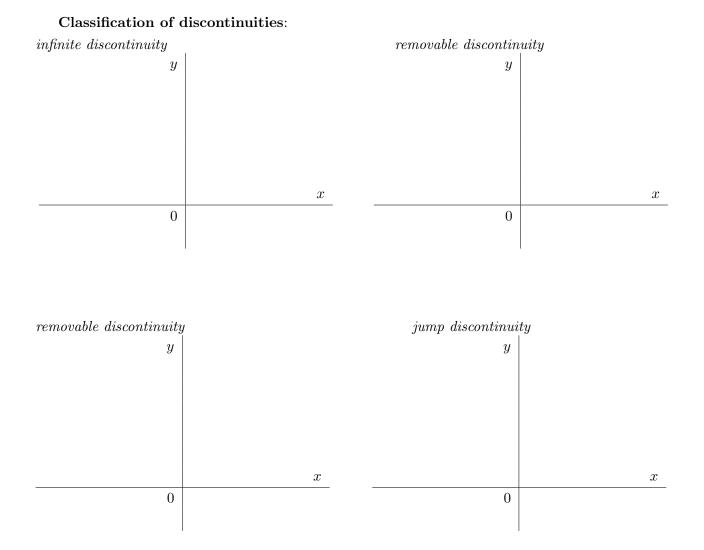

A function is said to be continuous on the interval [a, b] if it is continuous at each point in the interval.

Geometrically, if f is continuous at any point in an interval then its graph has no break in it (i.e. can be drawn without removing your pen from the paper).

REASONS FOR BEING DISCONTINUOUS:

f(a) is defined and $\lim_{x \to a} f(x)$ exists, but $\lim_{x \to a} f(x) \neq f(a)$

EXAMPLE 2. Explain why each function is discontinuous at the given point:

(a)
$$f(x) = \frac{2x}{x-3}, \quad x = 3$$

/

(b)
$$f(x) = \begin{cases} \frac{x^2 - 2x + 1}{x - 1} & \text{if } x \neq 1 \\ 5 & \text{if } x = 1, \end{cases}$$
 $x = 1$

DEFINITION 3. A function f is continuous from the right at x = a if

$$\lim_{x \to a^+} f(x) = f(a)$$

and f is continuous from the left at a if

$$\lim_{x \to a^-} f(x) = f(a).$$

REMARK 4. *Functions continuous on an interval if it is continuous at every number in the interval.* At the end point of the interval we understand continuous to mean continuous from the right or continuous from the left.

EXAMPLE 5. Find the interval(s) where $f(x) = \sqrt{9 - x^2}$ is continuous.

EXAMPLE 6. Find the constant c that makes g continuous on $(-\infty, \infty)$:

$$g(x) = \begin{cases} x^2 - c^2 & \text{if } x < 4 \\ cx^2 - 1 & \text{if } x \ge 4 \end{cases}$$

EXAMPLE 7. For each of the following, find all discontinuities, classify them by using limits, give the continuity interval(s) for the corresponding function. If the discontinuity is removable, find a function g that agrees with the given function except of the discontinuity point and is continuous at that point.

(a)
$$f(x) = \frac{x^2 - 9}{x^4 - 81}$$

(b)
$$f(x) = \frac{7}{x+12}$$

(c)
$$f(x) = \begin{cases} x^2 + x & \text{if } x < 2 \\ 8 - x & \text{if } x > 2 \\ 4 & \text{if } x = 2 \end{cases}$$

Intermediate Value Theorem: If f(x) is continuous on the closed interval [a, b] and N is any number strictly between f(a) and f(b), then there is a number c, a < c < b, so that f(c) = N.

EXAMPLE 8. If $f(x) = x^5 - 2x^3 + x^2 + 2$, show there a number c so that f(c) = 1.

EXAMPLE 9. Show that following equation has a solution (a root) between 1 and 2:

$$3x^3 - 2x^2 - 2x - 5 = 0.$$
