CHAPTER 3 – PLANNING AND SCHEDULING

Assumptions and Rules

- The machine scheduling problem (MSP) has an associated orderrequirement weighted digraph.
- In this class, the times given for tasks are assumed to be given in minutes, unless you are told otherwise in the problem.
- The tasks are arranged in a priority list that is independent of the digraph.
- No processor stays idle if there is a task to be done.
- If a processor starts working on a task, the work will continue until that task is complete. No multitasking is allowed.

A task is considered *ready* if all its predecessors in the digraph have been completed.

List Processing Algorithm

- 1. Assignment of Processors: The lowest numbered idle processor is assigned to the highest priority ready task until either all of the processors are assigned or all of the ready tasks are being worked on.
- 2. Status Check: When a processor completes a task, that processor becomes idle. Check for ready tasks and tasks not yet completed and determine which of the following applies:
 - a. If there are ready tasks, repeat Step 1.
 - b. If there are no ready tasks but not every task has been completed, the idle processor remains idle until more tasks are completed.
 - c. If all tasks are completed, the job is done.

Independent Tasks

When the tasks are independent, they can be performed in any order. Thus, the associated order-requirement digraph has no edges. There are different algorithms that can be used to schedule independent tasks, but we will use the List Processing Algorithm in this class.

What is the minimum time required to perform nine independent tasks with a total task time of 45 minutes on three machines if no task takes longer than 10 minutes?

Longest Task

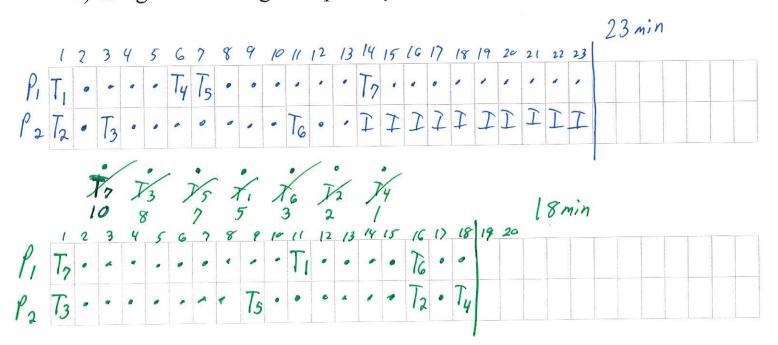

10min

Larger of

A decreasing time priority list is created by listing all the tasks from the longest to the shortest completion time. If there is a tie, the lower numbered task has the higher priority.

You have independent tasks of length 5, 2, 8, 1, 7, 3, 10. Using two processors, find the completion time using the list processing algorithm with

- a) the priority list using the tasks in the original order and then
- b) using a decreasing time priority list.

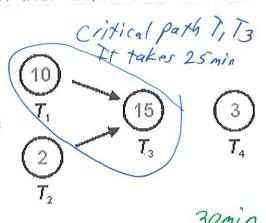

Are either of the completion times optimal? Yes, decreasing time was

Larger of Stangast Task 10 min
$$\frac{5um}{\# processors} = \frac{5+2+8+1+7+3+10}{2} = \frac{36min}{2} = 18min$$

Pizza Dinner

To make a pizza, you need to pre-heat the oven, unwrap the frozen pizza, and bake it for 15 minutes. You also need to find plates. The priority list for these tasks is T₃, T₂, T₄, T₁.

Schedule these tasks with one person working.

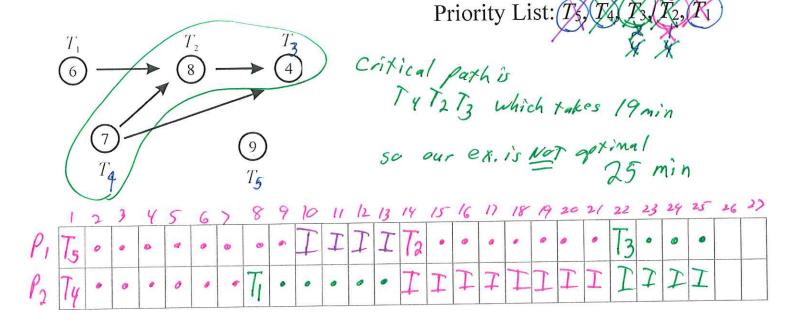

Schedule u	iese la	21/2	WILL	I OII	y p	OI O	OH	WO	1 171	115.									0	,	
T2 . Ty .	· T1 ·	0		. 0	0		•	T3	0		•	•	^	•	•	•	•	-		•	-

Will dinner get ready faster with two people? Priority List: T_3 T_3 T_4 T_5 T_6 T_7 T_7

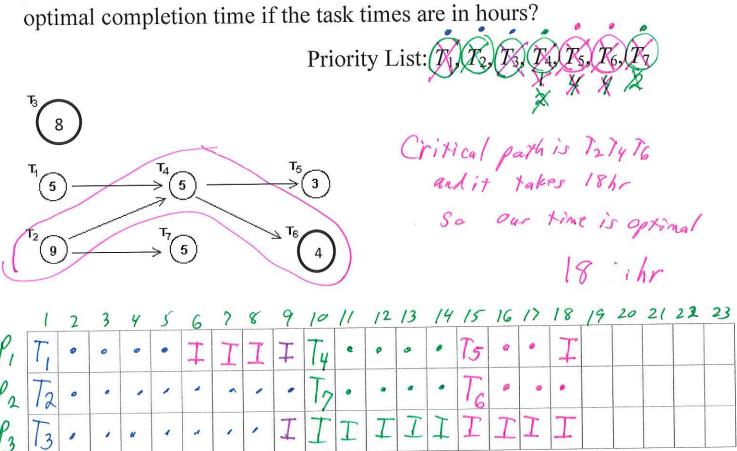

Example:

PI

Using the order-requirement digraph below, schedule the tasks on two processors using the priority list T_5 , T_4 , T_3 , T_2 , T_1 . What is the completion time if the times for each task are given in minutes? Is it optimal?

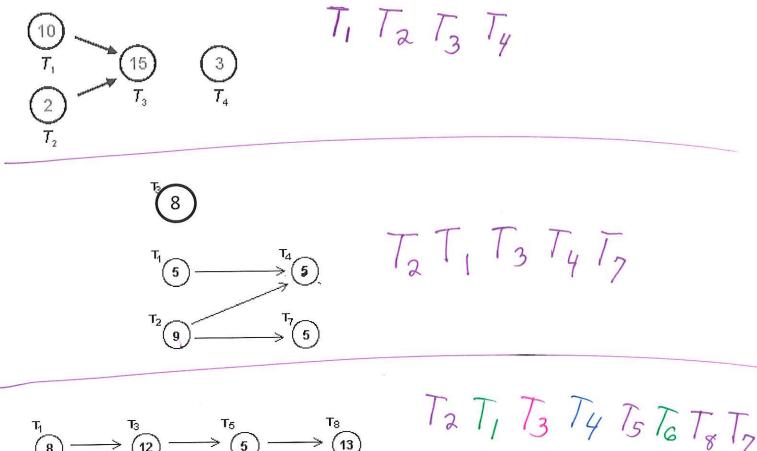

Using the order-requirement digraph below, schedule the tasks on three processors using the priority list T_1 , T_2 , T_3 , T_4 , T_5 , T_6 , T_7 . What is the optimal completion time if the task times are in hours?

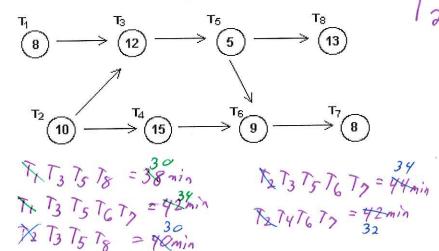

Creating a Priority List for Critical Path Scheduling

- 1. Find a task that heads a critical (longest) path in the orderrequirement digraph. If there is a tie, chose the lowest task number.
- 2. Place the task found in Step 1 next in the priority list.
- 3. Remove the task found in Step 1 from the digraph. Remove all edges attached to the removed task to form a new diagraph.
- 4. If all tasks have been removed, the list is completed. If tasks remain, return to step 1.

Create a critical path priority list for the digraphs below

You have the following weights (in ounces) to pack into bins that hold no more than 9 ounces. How should this be done? What is the minimum 4+6+1+2+4+5+1+3+6+2=3402 number of bins needed?

er of bins needed?
$$\frac{4+6+1+2+4+5+1+3+6+2=3402}{4,6,1,2,4,5,1,3,6,2} = 3.7 \text{ bins some need at least 4 bins}$$

Next-fit Algorithm (NF): Put items into the open bin until the next item will not fit. Close the bin and open a new bin for the next item. not optimal

SAMPLE EXAM QUESTIONS FROM CHAPTER 3

1. Given the order-requirement digraph below (with time given in minutes) and the priority list

$$T_4$$
, T_5 , T_6 , T_7 , T_8 , T_1 , T_2 , T_3 ,

apply the list-processing algorithm to construct a schedule using two processors. How much time does the resulting schedule require? Is the schedule optimal? Priority List: 14, 15, 16, 17, 18, 11, 12, 13

- 2. Using the given graph, determine the critical path priority list.
- (A) T_5 , T_4 , T_1 , T_2 , T_3
- (B) T_5 , T_4 , T_2 , T_1 , T_3
- (C) T_4 , T_1 , T_2 , T_3 , T_5
- (D) T_4 , T_1 , T_2 , T_5 , T_3
 - (E) None of these/need more information

3. What is the minimum	time requ	uired to perform	six independent tasks
with a total task time of			
more than 12 minutes?	1	E Sum	48min = 16min
(A) 2 minutes			
(B) 8 minutes		(Longest Task	12 min
(C) 12 minutes		14316	•

(C) 12 minutes (D) 16 minutes

(E) None of these/need more information

4. Use the decreasing-time-list processing algorithm to schedule these independent tasks on two machines:

4 minutes, 5 minutes, 8 minutes, 3 minutes, 3 minutes, 7 minutes

How much time does the resulting schedule require?

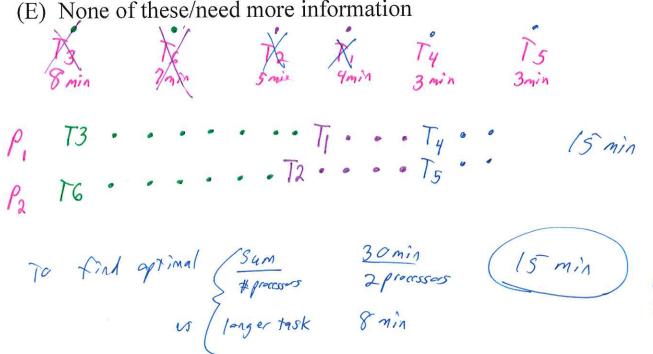

(A) 15 minutes

(B) 16 minutes

(C) 17 minutes

(D) 18 minutes

(E) None of these/need more information

5. Find the packing that results from the use of given bin-packing algorithm to pack the following weights into bins that can hold no more Optimal 54m = 37 = 4.625 bins so we need 5 bins than 8 lbs.

5 lbs, 7 lbs, 1 lb, 2 lbs, 4 lbs, 5 lbs, 1 lb, 1 lb, 3 lbs, 6 lbs, 2 lbs.

Are any of these packings optimal?
