## Math 409 Midterm 2 practice

## Name:

$\qquad$

This exam has 4 questions, for a total of 100 points.
Please answer each question in the space provided. No aids are permitted.

## Question 1. (40 pts)

In each of the following eight cases, indicate whether the given statement is true or false. No justification is necessary.
(a) Let $\left\{x_{n}\right\}$ and $\left\{y_{n}\right\}$ be convergent sequences in $\mathbb{R}$. Then the sequence $\left\{x_{n} y_{n}\right\}$ converges.
(b) $\lim _{x \rightarrow 1} \frac{x^{2}-1}{x-1}$ does not exist.
(c) Let $\left\{x_{n}\right\}$ be a sequence such that $x_{n} \in(0,1)$ for every $n \in \mathbb{N}$. Then $\left\{x_{n}\right\}$ has a subsequence which is Cauchy.
(d) $\lim _{x \rightarrow \infty} \frac{x-2 x^{2}+5 x^{3}}{6-x+x^{2}}=\infty$
(e) Let $\left\{x_{n}\right\}$ be a sequence in $\mathbb{R}$ with the property that each of its subsequences has a convergent subsequence. Then $\left\{x_{n}\right\}$ is bounded.
(f) If a function is differentiable on $\mathbb{R}$, then it is uniformly continuous on $\mathbb{R}$.
(g) Let $f$ be a function which is uniformly continuous on $\mathbb{R}$. Then the function $g$ defined by $g(x)=f(f(x))$ for all $x \in \mathbb{R}$ is uniformly continuous on $\mathbb{R}$.
(h) If $f:(0,1) \rightarrow \mathbb{R}$ is continuous and bounded, then $f$ is uniformly continuous.

## Question 2. (20 pts)

(a) Let $f$ be a function defined on an open interval containing a given point $a$. State what it means for $f(x)$ to converge to a number $L$ as $x$ approaches $a$.
(b) Let $a \in \mathbb{R}$ and let $f$ and $g$ be functions on $\mathbb{R}$ such that $\lim _{x \rightarrow a} f(x)$ and $\lim _{x \rightarrow a} g(x)$ both exist. Prove directly from the definition of a limit that $\lim _{x \rightarrow a}(f+g)(x)$ exists.

Question 3. (20 pts)
(a) State the Extreme Value Theorem.
(b) Give an example of a function $f$ which is bounded on $[0,1]$ but does not have a maximum on $[0,1]$.

Question 4. (20 pts)
(a) State the Intermediate Value Theorem.
(b) Assuming the fact that the function $\cos x$ is continuous on $\mathbb{R}$, prove that there exists an $x \in \mathbb{R}$ such that $x^{6}+x^{4}+1=2 \cos x^{3}$.
