Name_____

MATH 251 Exam 2 Version B Fall 2018

Sections 504/505 Solutions P. Yasskin

Multiple Choice:	(5 points each.	No part credit.)
------------------	-----------------	------------------

1-11	/55	13	/25
12	/20	EC	/5
		Total	/105

1. Which of these functions has the contour plot at the right?

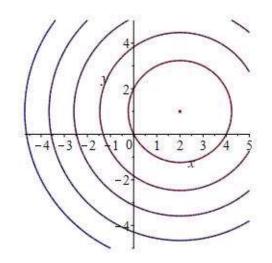

a.
$$\sqrt{x^2 + y^2 - 4x - 2y + 9}$$
 Correct Choice

b.
$$\sqrt{x^2 + y^2 + 4x + 2y + 5}$$

$$\mathbf{c}. \quad \sqrt{x^2 + y^2 + 4x - 2y + 1}$$

d.
$$x^2 + y^2 - 4x + 2y$$

e.
$$x^2 + y^2 + 4x + 2y$$

Solution: Completing the square, the functions are

a.
$$\sqrt{(x-2)^2 + (y-1)^2 + 4}$$
 level sets are all circles centered at $(2,1)$ Correct

b.
$$\sqrt{(x+2)^2 + (y+1)^2}$$
 level sets are all circles centered at $(-2,-1)$

c.
$$\sqrt{(x+2)^2+(y-1)^2-4}$$
 The level sets are circles centered at $(-2,1)$ of radius ≥ 2

d.
$$(x-2)^2 + (y+1)^2 - 5$$
 level sets are all circles centered at $(2,-1)$

e.
$$(x+2)^2 + (y+1)^2 - 5$$
 level sets are all circles centered at $(-2,-1)$

2. If $f = x \cos y - y \sin x$ which of the following is INCORRECT?

a.
$$\frac{\partial^3 f}{\partial x \partial x \partial x} = y \cos x$$

b.
$$\frac{\partial^3 f}{\partial y \partial x \partial x} = \sin x$$

c.
$$\frac{\partial^3 f}{\partial x \partial y \partial x} = -\sin x$$
 Correct Choice

d.
$$\frac{\partial^3 f}{\partial x \partial x \partial y} = \sin x$$

e.
$$\frac{\partial^3 f}{\partial y \partial y \partial y} = x \sin y$$

Solution: By Clairaut's Theorem, $f_{yxx} = f_{xyx} = f_{xxy}$. Since answer (b) equals answer (d) but not answer (c), answer (c) must be wrong.

- **3**. The partial derivative $\frac{\partial f}{\partial x}\Big|_{(2,3)}$ gives the
 - **a.** slope at y = 3 of the x-trace of f with x fixed at 2.
 - **b.** slope at x = 2 of the x-trace of f with y fixed at 3. Correct Choice
 - **c**. slope at y = 3 of the y-trace of f with x fixed at 2.
 - **d**. slope at x = 2 of the y-trace of f with y fixed at 3.

Solution: An x-trace has y fixed while a y-trace has x fixed.

 $\frac{\partial f}{\partial x}\Big|_{(2,3)}$ needs y fixed at 3 while we differentiate with respect to x at x=2.

- **4**. Find the tangent plane to the graph of $z = x^2y^3$ at (x,y) = (2,1). The z-intercept is
 - **a**. 20
 - **b**. 16
 - **c**. 4
 - d. -16 Correct Choice
 - **e**. -20

Solution: Let $f(x,y) = x^2y^3$. The tangent plane is $z = f(2,1) + f_x(2,1)(x-2) + f_y(2,1)(y-1)$. We compute f(2,1) = 4 $f_x(x,y) = 2xy^3$ $f_x(2,1) = 4$ $f_y(x,y) = 3x^2y^2$ $f_y(2,1) = 12$

So the tangent plane is z = 4 + 4(x-2) + 12(y-1) = 4x + 12y - 16 and the z-intercept is -16.

- **5**. The equation $x^3z^3 y^2z^2 = -1$ implicitly defines z as a function of x and y. Find $\frac{\partial z}{\partial y}$ at (x,y,z)=(2,3,1).
 - **a**. 2
 - **b**. 1 Correct Choice
 - **c**. 0
 - **d**. -1
 - **e**. -2

Solution: $x^3 3z^2 \frac{\partial z}{\partial y} - 2yz^2 - y^2 2z \frac{\partial z}{\partial y} = 0$ $24 \frac{\partial z}{\partial y} - 6 - 18 \frac{\partial z}{\partial y} = 0$ $\frac{\partial z}{\partial y} = 1$

- **6**. Find the equation of the plane tangent to the surface $x^3z^3 y^2z^2 = -1$ at (x,y,z) = (2,3,1). The *z*-intercept is
 - **a**. c = -12
 - **b**. c = -2
 - **c**. c = 2 Correct Choice
 - **d**. c = 6
 - **e**. c = 12

Solution: Let $F = x^3z^3 - y^2z^2$. Then $\vec{\nabla}F = \langle 3x^2z^3, -2yz^2, 3x^3z^2 - 2y^2z \rangle$. So the normal is $\vec{N} = \vec{\nabla}F\Big|_{(2,3,1)} = \langle 12, -6, 6 \rangle$ and the tangent plane is $\vec{N} \cdot X = \vec{N} \cdot P$ or $12x - 6y + 6z = 12 \cdot 2 - 6 \cdot 3 + 6 \cdot 1 = 12$. So the *z*-intercept is c = 2.

- 7. The strength, S, of a support beam of length L, width W and height H is given by $S = \frac{WH^2}{L}$. Currently, L = 50 cm, W = 5 cm and H = 10 cm. Use the linear approximation to estimate the change in the strength if L increases by 5 cm, W increases by 0.5 cm and H increases by 1 cm?
 - **a**. 10
 - **b**. 8
 - **c**. 6
 - **d**. 4
 - e. 2 Correct Choice

Solution: The partial derivatives of S are:

$$\frac{\partial S}{\partial L} = -\frac{WH^2}{L^2} = -\frac{5 \cdot 10^2}{50^2} = -\frac{1}{5} \qquad \frac{\partial S}{\partial W} = \frac{H^2}{L} = \frac{10^2}{50} = 2 \qquad \frac{\partial S}{\partial H} = \frac{2WH}{L} = \frac{2 \cdot 5 \cdot 10}{50} = 2$$

The change in strength is approximately its differential:

$$dS = \frac{\partial S}{\partial L}dL + \frac{\partial S}{\partial W}dW + \frac{\partial S}{\partial H}dH = -\frac{1}{5} \cdot 5 + 2 \cdot 0.5 + 2 \cdot 1 = 2$$

- **8**. Dark Invader is flying through a dark matter field whose density is given by $\delta = xyz^2$. If Dark's current position is $\vec{r}(2) = \langle 3, 2, 1 \rangle$ and his velocity is $\vec{v}(2) = \langle 1, 2, 1 \rangle$, find the rate at which the density of dark matter is changing as seen by Dark.
 - **a**. 10
 - **b**. $10\sqrt{6}$
 - **c**. $20\sqrt{6}$
 - d. 20 Correct Choice
 - **e**. $\frac{20}{\sqrt{6}}$

Solution:
$$\vec{\nabla}\delta = \langle yz^2, xz^2, 2xyz \rangle$$
 $\vec{\nabla}\delta \Big|_{(3,2,1)} = \langle 2, 3, 12 \rangle$ $\frac{d\delta}{dt} = \vec{v} \cdot \vec{\nabla}\delta = 2 + 6 + 12 = 20$

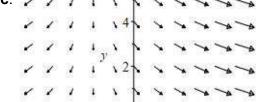

- **9**. When there is no wind, a weather balloon floats in the direction of **decreasing** air density. If the air density is $\delta = x^2 + y^2 + z^3$ and the balloon is located at (x,y,z) = (2,6,1), find the vector direction in which the balloon floats.
 - **a.** $\left\langle \frac{4}{13}, \frac{12}{13}, \frac{3}{13} \right\rangle$
 - **b**. $\left\langle \frac{-4}{13}, \frac{12}{13}, \frac{-3}{13} \right\rangle$
 - c. $\left\langle \frac{-4}{13}, \frac{-12}{13}, \frac{-3}{13} \right\rangle$ Correct Choice
 - **d**. $\left\langle \frac{4}{13}, \frac{-12}{13}, \frac{3}{13} \right\rangle$

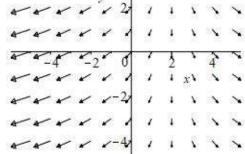

Solution:
$$\vec{\nabla}\delta = \langle 2x, 2y, 3z^2 \rangle$$
 $\vec{\nabla}\delta \Big|_{(2,6,1)} = \langle 4, 12, 3 \rangle$ $|\vec{\nabla}\delta | = \sqrt{16 + 144 + 9} = 13$

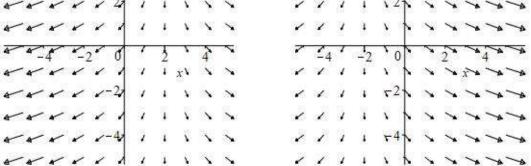

The density **decreases** in the direction $\hat{u} = \frac{-\vec{\nabla}\delta}{\left|\vec{\nabla}\delta\right|} = \left\langle \frac{-4}{13}, \frac{-12}{13}, \frac{-3}{13} \right\rangle$.

- **10**. Which is the plot of the vector field $\vec{F} = \langle x-2,-2 \rangle$?

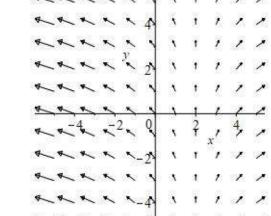

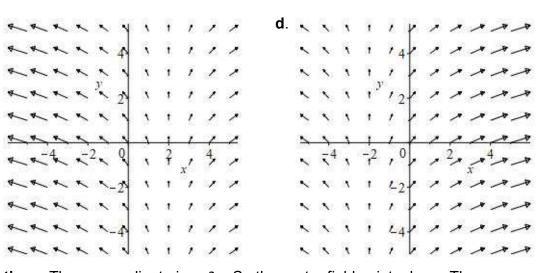

Correct Choice

Solution: The y-coordinate is -2. So the vector field points down. The x-coordinate is x-2. So the x coordinate is 0 when x = 2. That is plot (a).

- **11**. Find a scalar potential, f(x,y,z), for $\vec{F} = \left\langle -\frac{yz}{r^2}, \frac{z}{x}, \frac{y}{x} \right\rangle$. Then f(4,4,4) f(1,1,1) =
 - **a**. 1
 - **b**. 2
 - **c**. 3 **Correct Choice**
 - **d**. 4
 - **e**. 5

Solution: $\vec{\nabla} f - \vec{F}$ $\partial_x f = -\frac{yz}{x^2}$, $\partial_y f = \frac{z}{x}$, $\partial_z f = \frac{y}{x}$ $f = \frac{yz}{x}$ f(4,4,4) - f(1,1,1) = 4 - 1 = 3

Work Out: (Points indicated. Part credit possible. Show all work.)

12. (20 points) Find the point(s), X = (x, y, z), on the hyperboloid $x^2 + y^2 - z^2 = 1$ where the normal vector points in the same direction as $\vec{v} = \langle 1, 3, -3 \rangle$.

Solution: Let $F = x^2 + y^2 - z^2$. Then the normal is $\vec{N} = \vec{\nabla} F = \langle 2x, 2y, -2z \rangle$. The normal is in the same direction as \vec{v} if $\vec{N} = \lambda \vec{v}$, i.e.

$$2x = \lambda$$
 $2y = \lambda 3$ $-2z = -\lambda 3$

Since $\lambda = 2x$, we have 2y = 6x and -2z = -6x or y = 3x and z = 3x. We substitute these into the equation of the hyperboloid:

$$1 = x^2 + y^2 - z^2 = x^2 + 9x^2 - 9x^2 = x^2$$
 \Rightarrow $x = \pm 1$

So the points are

$$(x,y,z) = (1,3,3)$$
 and $(x,y,z) = (-1,-3,-3)$

13. (25 points+5 points extra credit) Find the point, X = (x, y, z), on the upper half of the hyperboloid $x^2 + y^2 - z^2 = 1$ which is closest to the point P = (6, 8, 0). What is the distance?

You may solve by either method. There is 5 points extra credit for solving by both methods.

Solution: We are minimizing the distance from P to X, or the square of the distance:

$$f = (x-6)^2 + (y-8)^2 + z^2$$

subject to the constraint:

$$g = x^2 + y^2 - z^2 = 1$$

.....

Method: Lagrange Multipliers:

We compute the gradients:

$$\vec{\nabla} f = \langle 2(x-6), 2(y-8), 2z \rangle$$
 $\vec{\nabla} g = \langle 2x, 2y, -2z \rangle$

So the Lagrange equations are:

$$2(x-6) = 2x\lambda$$
 $2(y-8) = 2y\lambda$ $2z = -2z\lambda$

The z equation gives $\lambda = -1$. Then the x and y equations give:

$$x - 6 = -x \qquad \qquad y - 8 = -y$$

or x = 3 and y = 4. Substituting into the constraint gives

$$z^2 = x^2 + y^2 - 1 = 9 + 16 - 1 = 24$$
 $z = \sqrt{24} = 2\sqrt{6}$

.....

Method: Eliminate the Constraint:

We solve the constraint for $z^2 = x^2 + y^2 - 1$ and substitute into the square of the distance:

$$f = (x-6)^2 + (y-8)^2 + x^2 + y^2 - 1$$

We set the derivatives equal to $\ 0$ and solve:

$$f_x = 2(x-6) + 2x = 0$$
 \Rightarrow $x = 3$

$$f_v = 2(v - 8) + 2v = 0 \implies v = 4$$

We substitute back to get

$$z = \sqrt{x^2 + y^2 - 1} = \sqrt{9 + 16 - 1} = \sqrt{24} = 2\sqrt{6}$$

The point is $(3,4,2\sqrt{6})$ and the distance is

$$D = \sqrt{f} = \sqrt{(x-6)^2 + (y-4)^2 + z^2} = \sqrt{9+16+24} = 7$$
